HP-45
APPLICATIONS BOOK

Hewlett Packard
Advanced Products Division

Your Applications Book

The Applications Book is a representative collection of key sequence routines for solving problems with your HP-45 Pocket Calculator.

We suggest that you first read the introductory material explaining the Standard Key Sequence Format. Then find the routine you want, and use it. Numerical examples are provided to enable you to try out routines before using them. An understanding of the HP-45 Owner's Handbook is also required if, in addition, you wish to track the changes in the calculator's memory on a step-by-step basis.

The body of the book is arranged in alphabetic sequence of topics—those you are likely to think of when you want a routine. Thus, Complex Number Operations are presented in the “C” section; Progressions are presented in the “P” section, including arithmetic, geometric, and harmonic progressions. In addition to such main entries, cross-reference entries enable the reader to find a routine by an alternate route. Thus, in the “A” section (between “Arithmetic Mean” and “Average”) a cross-reference entry, “Arithmetic Progressions,” refers the reader to the page under “Progressions” where the routine is presented. Similarly, cross-references are provided for “Geometric Progressions,” and “Harmonic Progressions,” etc. The contents section at the front is arranged logically (instead of by page order) to show all the routines available under each of seven broad categories. The back cover contains an index.

Two key sequence forms are included inside the back cover of this manual. You may wish to duplicate these forms and record your own key step programs.

4 Standard Key Sequence Format

Standard Key Sequence Format

Shown below is the key sequence routine for computing the roots of the Quadratic Equation:

$$AX^2 + BX + C = 0$$

Using A, B, and C, which you supply as data, the routine produces an intermediate result D. If $D < 0$, one root is the complex conjugate of the other; the real and imaginary parts of one complex root develop on lines 10 and 11. Except for the opposite sign of the imaginary part, the other complex root is identical. If $D \geq 0$, the roots are real and develop on lines 6 and 9 (if $-B/2A \geq 0$) or on lines 7 and 9 (if $-B/2A < 0$).

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1	A	STO 1 ↑ +		
2	B	x↔y ÷ CHS ↑ x ²		
3	C	STO 2 RCL 1 ÷		
4		-	D	If D < 0, go to 10
5		√x x↔y	-B/2A	If -B/2A < 0, go to 7
6		+ x ²	x ₁	Go to 8
7		- CHS x ²	x ₁	
8		RCL 1 x RCL 2		
9		x↔y ÷	x ₂	Stop
10		CHS √x x↔y	u	
11		x↔y	v	

To execute the sequence, start with line 1 and read from left to right, making the appropriate keystrokes as you proceed. Interpret the respective columns as follows:

Data: Information to be supplied by you, the user. In the sample case, lines 1, 2 and 3 prompt the reader to enter coefficients A, B and C. To enter negative data, it is merely necessary to press **CHS** after pressing the data value.

Operations: The keys to be pressed after you enter any requested data item for the line. \uparrow is the symbol used to denote the **ENTER** key of the HP-45. All other key designations are identical to the HP-45 keys. Ignore any blank positions in the operations column. The gold prefix key is represented as a solid key with no lettering (e.g., the first stroke of line 5). The next key to be pressed is denoted by the corresponding functional name (e.g., \sqrt{x} , second stroke, line 5) which, on the keyboard is printed in gold.

Display: Intermediate or final results which you should, in most cases, jot down. In the sample case, D is developed so that the reader can decide which line (5 or 10) to execute next.

Remarks: Conditional and unconditional jumps to specified lines or other information for the reader. In the sample case, the reader is prompted to continue with line 10 (ignoring lines 5 through 9) if D is negative. If the condition fails, execution continues on the next line. In the sample case, the reader proceeds to line 5, if D is zero or positive.

Thus, lines are read in sequential order except where the remarks column directs otherwise (as in line 4 of the sample case). To assist the reader in distinguishing lines to be repeated, a sequence of lines making up an iterative process is outlined with a bold border. The following sequence for computing chi-square statistic for goodness of fit illustrates this convention.

Formula:

$$\chi^2 = \sum_{i=1}^n \frac{(O_i - E_i)^2}{E_i}$$

where O_i = observed frequency

E_i = expected frequency

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1		CLX \uparrow [] [] []		
2	O_i	\uparrow [] [] [] []		Perform 2-4 for $i = 1, 2, \dots, n$
3	E_i	STO 1 - x^2 RCL		
4		1 \div + [] []		

In a few cases, an iterative process is embedded in a series of lines which are themselves iterated.

Analysis of Variance (One Way)

The one-way analysis of variance tests the differences between means of k treatment groups, group i ($i = 1, 2, \dots, k$) has n_i observations (treatment may have equal or unequal number of observations).

The following keysequence yields the analysis of variance table, sum of squares, mean squares, degrees of freedom, and the F ratio.

Formulas:

$$\text{Total SS} = \sum_{i=1}^k \sum_{j=1}^{n_i} x_{ij}^2 - \frac{\left(\sum_{i=1}^k \sum_{j=1}^{n_i} x_{ij} \right)^2}{\sum_{i=1}^k n_i}$$

$$\text{Treat SS} = \sum_{i=1}^k \frac{\left(\sum_{j=1}^{n_i} x_{ij} \right)^2}{n_i} - \frac{\left(\sum_{i=1}^k \sum_{j=1}^{n_i} x_{ij} \right)^2}{\sum_{i=1}^k n_i}$$

$$\text{Error SS} = \text{Total SS} - \text{Treat SS}$$

$$\text{Treat df} = k - 1$$

$$\text{Error df} = \sum_{i=1}^k n_i - k$$

$$\text{Treat MS} = \frac{\text{Treat SS}}{\text{Treat df}}$$

$$\text{Error MS} = \frac{\text{Error SS}}{\text{Error df}}$$

$$F = \frac{\text{Treat MS}}{\text{Error MS}} \quad \left(\text{with } k-1 \text{ and } \sum_{i=1}^k n_i - k \text{ degrees of freedom} \right)$$

16 Analysis of Variance

Example:

		j					
i \		1	2	3	4	5	6
Treatment	1	10	8	5	12	14	11
	2	6	9	8	13		
	3	14	13	10	17	16	

Answers: Total SS = 172.93

Treat SS = 66.93

Error SS = 106.00

Treat df = 2.00

Treat MS = 33.47

Error df = 12.00

Error MS = 8.83

F = 3.79 (with 2 and 12 degrees of freedom)

Base Conversions

Note:

Base conversion algorithms are given for positive values only. To convert a negative number, change sign, convert, and change sign of result.

Decimal integer to integer in any base

$$I_{10} \rightarrow J_b$$

In the following key sequence, $f + 1$ is the number of digits in J_b .

d_i ($i = 1, \dots, f + 1$) represents the i^{th} digit in J_b , counting from left to right, i.e.

$$J_b = (d_1 d_2 \dots d_{f+1})_b$$

For large numbers, $J_b = (d_1 \cdot d_2 \dots d_{f+1})_b \cdot b^f$, see example 3.

9	11	-	x				6.00	d ₃ = 6

Example 2:

Convert 513 to octal (base 8).

Answer:

$$513_{10} = 1001_8$$

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	8	↑	↑					
2	513	STO	1	ln	x ^z y	ln		
3		÷					3.00	f = 3
4		CLX						
5	3	x ^z y	↑	↑	RCL	1		
6		R↓	R↓	x ^z y		y ^x		
7		÷					1.00	d ₁ = 1
8	1	-	x				0.02	d ₂ = 0
9	0	-	x				0.12	d ₃ = 0
10	0	-	x				1.00	d ₄ = 1

Example 3:

Convert 6.023×10^{23} to octal.

Answer:

$$6.023 \times 10^{23} = 1.7743_8 \times 8^{26}$$

Note:

If we consider 6.023×10^{23} to be a scientific measurement good only to 4 significant digits, it is meaningless for the octal representation to contain more than 5 significant digits. Therefore, we stop before the loop is completed.

Bonds

Formulas:

n = total number of days between purchase and maturity

C = decimal coupon rate (on an annual basis)

i = annual yield to maturity (as a decimal)

PV = bond price

If $n < 182.5$,

$$PV = \frac{200 + 100C}{2 + \frac{n}{180} \cdot i} - \left(1 - \frac{n}{180}\right) \frac{100C}{2}$$

If $n > 182.5$,

$$PV = 100 \left(1 + \frac{i}{2}\right)^{\frac{-n}{182.5}} + 100 \left(\frac{C}{i}\right) \left\{ \left(1 + \frac{i}{2}\right)^j - \left(1 + \frac{i}{2}\right)^{\frac{-n}{182.5}} \right\} - \frac{100Cj}{2}$$

where $j = 1 - \text{fractional part of } \frac{n}{182.5}$

Example 1:

What is the price of a 4% bond yielding 3% and maturing in 99 days?

Answer:

100.27

Example 2:

What is the price of a bond which has a coupon rate of 4.5%, a yield of 3.22% to maturity, and the number of days between purchase and maturity is 1868?

Answer:

105.99

Cash Flow Analysis (Discounted)

Formula:

PV_0 = original investment

PV_k = cash flow of the k^{th} period

i = discount rate per period (as a decimal)

C_k = net present value at period k

$$C_k = -PV_0 + \sum_{j=1}^n \frac{PV_j}{(1+i)^j}$$

Example:

You are offered an investment opportunity for \$100,000 at a capital cost of 10% after taxes. Will this investment be profitable based on the following cash flows?

Year	Cash flow
1	\$34,000
2	\$27,500
3	\$59,700
4	\$ 7,800

Answer:

Final value $C_4 = \$3817.36$ is positive, so the investment will be profitable.

36 Chi-Square Statistics

Testing a population variance

Given a random sample of size n from a normal population (variance σ^2 is unknown), we can use

$$\chi^2 = \frac{(n-1)s^2}{\sigma_0^2}$$

(where s^2 is the sample variance) to test the null hypothesis

$$H_0: \sigma^2 = \sigma_0^2$$

Degrees of freedom = $n - 1$.

Example:

Given a sample $\{2.1, 0.5, -3.1, 1.4, -0.92, -1.35, 1.2\}$ and $\sigma_0^2 = 2.5$, find chi-square.

Answer:

$$\chi^2 = 8.13 \text{ (d.f. = 6)}$$

Bartlett's chi-square

Formula:

$$\chi^2 = \frac{f \ln S^2 - \sum_{i=1}^k f_i \ln S_i^2}{1 + \frac{1}{3(k-1)} \left[\left(\sum_{i=1}^k \frac{1}{f_i} \right) - \frac{1}{f} \right]}$$

where S_i^2 = sample variance of the i^{th} sample

f_i = degrees of freedom associated with S_i^2

$i = 1, 2, \dots, k$

k = number of samples

$$S^2 = \frac{\sum_{i=1}^k f_i S_i^2}{f}$$

$$f = \sum_{i=1}^k f_i$$

This χ^2 has a chi-square distribution (approximately) with $k - 1$ degrees of freedom which can be used to test the null hypothesis that $S_1^2, S_2^2, \dots, S_k^2$ are all estimates of the same population variance σ^2 .

H_0 : Each of $S_1^2, S_2^2, \dots, S_k^2$ is an estimate of σ^2 .

Example:

i	1	2	3	4	5	6
f_i	10	20	17	18	8	15
S_i^2	5.5	5.1	5.2	4.7	4.8	4.3

Answer:

$$\chi^2 = 0.25 \quad (\text{d.f.} = 5)$$

Complex arc tangent

Formula:

$$\tan^{-1}(a + ib) = \frac{1}{2} \left[\pi - \tan^{-1} \left(\frac{1+b}{a} \right) - \tan^{-1} \left(\frac{1-b}{a} \right) \right] + \frac{i}{4} \ln \left[\frac{a^2 + (1+b)^2}{a^2 + (1-b)^2} \right]$$

$$= u + iv$$

where $(a + ib)^2 \neq -1$

Example:

$$\tan^{-1}(5 + 8i) = 1.51 + 0.09i$$

Coordinate Translation and Rotation (Rectangular)

Suppose point P has coordinates (x, y) with respect to a coordinate system having x, y axes. After translating the origin to (x_0, y_0) , rotate the two axes through an angle α . Find the coordinates (x', y') of P with respect to the new system having x', y' axes.

Formulas:

$$x' = (x - x_0) \cos \alpha + (y - y_0) \sin \alpha$$

$$y' = -(x - x_0) \sin \alpha + (y - y_0) \cos \alpha$$

Example:

If $(x_0, y_0) = (3, 2)$, $(x, y) = (5, 5)$, $\alpha = 20^\circ$

then $(x', y') = (2.91, 2.14)$

Covariance and Correlation Coefficient

Formulas:

Covariance

$$S_{xy} = \frac{1}{n-1} \left[\sum x_i y_i - \frac{1}{n} \sum x_i \sum y_i \right]$$

Correlation coefficient

$$r = \frac{S_{xy}}{S_x S_y}$$

where

$$S_x = \left[\frac{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}{n-1} \right]^{1/2}$$

$$S_y = \left[\frac{\sum y_i^2 - \frac{(\sum y_i)^2}{n}}{n-1} \right]^{1/2}$$

n = number of data points

Example:

x_i	26	30	44	50	62	68	74
y_i	92	85	78	81	54	51	40

Answers:

$$S_{xy} = -354.14$$

$$r = -0.96$$

$$(S_x = 18.50, S_y = 20.00)$$

Cubic Equation

Formulas:

The general cubic equation

$$x^3 + ax^2 + bx + c = 0 \quad (1)$$

can be reduced to the form

$$y^3 + py + q = 0 \quad (2)$$

by letting

$$x = y - \frac{a}{3}$$

where

$$p = b - \frac{a^2}{3}$$

$$q = 2\left(\frac{a}{3}\right)^3 - \frac{ab}{3} + c.$$

The reduced equation (2) has solutions

$$y_1 = A + B$$

$$y_2 = \frac{-(A+B)}{2} + i \frac{\sqrt{3}(A-B)}{2}$$

$$y_3 = \frac{-(A+B)}{2} - i \frac{\sqrt{3}(A-B)}{2}$$

where

$$A = \sqrt[3]{\frac{-q}{2} + \sqrt{d}}$$

$$B = \sqrt[3]{\frac{-q}{2} - \sqrt{d}}$$

$$d = \frac{q^2}{4} + \frac{p^3}{27}$$

Case 1. $d > 0$: there exist one real and two complex roots.

Case 2. $d = 0$: there exist three real roots of which at least two are equal.

Case 3. $d < 0$: there exist three real and distinct roots.

Equation (1) has solutions

$$x_i = y_i - \frac{a}{3}, \quad i = 1, 2, 3.$$

Example 1:

Solve $x^3 + 2x^2 - 5x - 6 = 0$

Answers:

$$\begin{aligned} x_1 &= 2.00 \\ x_2 &= -3.00 \\ x_3 &= -1.00 \\ (d &= -8.33). \end{aligned}$$

Example 2:

Solve $x^3 - 4x^2 + 8x - 8 = 0$

Answers:

$$\begin{aligned} x_1 &= 2.00 \\ x_2 &= 1 + 1.73i \\ x_3 &= 1 - 1.73i \\ (d &= 1.78) \end{aligned}$$

Curve Fitting

Linear regression and correlation coefficient

Formulas:

This routine fits a straight line

$$y = ax + b$$

to a set of data points

$$\{(x_i, y_i), i = 1, \dots, n\}$$

by the least squares method.

$$a = \frac{\sum x_i y_i - \frac{\sum x_i \sum y_i}{n}}{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}$$

$$b = \bar{y} - a\bar{x}$$

where

$$\bar{x} = \frac{\sum x_i}{n}$$

$$\bar{y} = \frac{\sum y_i}{n}$$

78 Curve Fitting

coefficient of determination:

$$r^2 = \frac{\left[\sum x_i y_i - \frac{\sum x \sum y}{n} \right]^2}{\left[\sum x_i^2 - \frac{(\sum x_i)^2}{n} \right] \left[\sum y_i^2 - \frac{(\sum y_i)^2}{n} \right]}$$

r^2 can be interpreted as the proportion of total variation about the mean \bar{y} explained by the regression. In other words, r^2 measures the "goodness of fit" of the regression line. Note that $0 \leq r^2 \leq 1$, and if $r^2 = 1$, we have a perfect fit.

Correlation coefficient

$$r = \sqrt{r^2}$$

(r takes the sign of a)

$\sum y_i^2$, $\sum x_i y_i$, n , $\sum x_i^2$, $\sum x_i$, $\sum y_i$ are in storage registers R_3 through R_8 .

Example:

x_i	26	30	44	50	62	68	74
y_i	92	85	78	81	54	51	40

Answers:

$$y = -1.03x + 121.04$$

$$r^2 = 0.92$$

$$r = -0.96$$

$$n = 7$$

$$\sum x_i = 354$$

$$\sum x_i^2 = 19956$$

$$\sum y_i = 481$$

$$\sum y_i^2 = 35451$$

$$\sum x_i y_i = 22200$$

Multiple linear regression (three variables)

For the set of data points (x_i, y_i, z_i) , this key sequence fits a linear equation of the form

$$z = a_0 + a_1 x + a_2 y$$

by the method of least squares.

Formulas:

Regression coefficients a_0 , a_1 , a_2 can be found by solving the normal equations:

$$\begin{cases} \Sigma z_i = a_0 n + a_1 \Sigma x_i + a_2 \Sigma y_i \\ \Sigma x_i z_i = a_0 \Sigma x_i + a_1 \Sigma x_i^2 + a_2 \Sigma x_i y_i \\ \Sigma y_i z_i = a_0 \Sigma y_i + a_1 \Sigma x_i y_i + a_2 \Sigma y_i^2 \end{cases}$$

$$i = 1, 2, \dots, n$$

$$a_2 = \frac{A - B}{[n \Sigma x_i^2 - (\Sigma x_i)^2] [n \Sigma y_i^2 - (\Sigma y_i)^2] - [n \Sigma x_i y_i - (\Sigma x_i)(\Sigma y_i)]^2}$$

where $A = [n \Sigma x_i^2 - (\Sigma x_i)^2] [n \Sigma y_i z_i - (\Sigma y_i)(\Sigma z_i)]$

$$B = [n \Sigma x_i y_i - (\Sigma x_i)(\Sigma y_i)] [n \Sigma x_i z_i - (\Sigma x_i)(\Sigma z_i)]$$

$$a_1 = \frac{[n \Sigma x_i z_i - (\Sigma x_i)(\Sigma z_i)] - a_2 [n \Sigma x_i y_i - (\Sigma x_i)(\Sigma y_i)]}{n \Sigma x_i^2 - (\Sigma x_i)^2}$$

$$a_0 = \frac{1}{n} (\Sigma z_i - a_2 \Sigma y_i - a_1 \Sigma x_i)$$

$\Sigma x_i y_i$, $\Sigma x_i z_i$, $\Sigma y_i z_i$, Σy_i^2 , n , Σx_i^2 , Σx_i , Σy_i , Σz_i are in storage registers R_1 through R_9 .

Example:

x	1.5	0.45	1.8	2.8
y	0.7	2.3	1.6	4.5
z	2.1	4.0	4.1	9.4

Answer:

$$z = -0.10 + 0.79x + 1.63y$$

82 Curve Fitting

Parabola (least squares fit)

Formula:

For a set of data points $\{(x_i, y_i), i = 1, 2, \dots, n\}$, this routine fits a parabola

$$y = a_0 + a_1x + a_2x^2$$

which is a special case of the three variable multiple regression model

$$z = a_0 + a_1x + a_2y$$

(if we replace y by x^2 and z by y).

$\Sigma x_i^3, \Sigma x_i y_i, \Sigma x_i^2 y_i, \Sigma x_i^4, n, \Sigma x_i^2, \Sigma x_i, \Sigma y_i$ are in registers R_1 through R_8 .

Example:

x_i	0	1	1.5	3	5
y_i	2.1	2	-5	-24.5	-80

Answer:

$$y = 2.28 + 1.85x - 3.66x^2$$

84 Curve Fitting

Least squares regression of $y = cx^a + dx^b$

Formula:

This key sequence determines the coefficients c, d of the equation

$$y = cx^a + dx^b$$

for a set of data points

$$\{(x_i, y_i), i = 1, 2, \dots, n\},$$

where a, b are any given real numbers.

$$d = \frac{(\sum x_i^{2a})(\sum x_i^b y_i) - (\sum x_i^a y_i)(\sum x_i^{a+b})}{(\sum x_i^{2b})(\sum x_i^{2a}) - (\sum x_i^{a+b})^2}$$

$$c = \frac{\sum x_i^a y_i - d \sum x_i^{a+b}}{\sum x_i^{2a}}$$

where $x_i > 0$ for $i = 1, 2, \dots, n$.

Example:

$$a = \frac{1}{2}, \quad b = 3$$

x_i	1	4	9	16
y_i	9	-44	-699	-4056

Answer:

$$y = 10x^{1/2} - x^3$$

86 Curve Fitting

Power curve (least squares fit)

Formula:

For a given set of data points

$$\{(x_i, y_i), i = 1, 2, \dots, n\}$$

fit a power curve of the form

$$y = ax^b$$

$$(a > 0)$$

By writing this equation as

$$\ln y = b \ln x + \ln a$$

the problem can be solved as a linear regression problem.

Example:

x_i	26	30	44	50	62	68	74
y_i	92	85	78	81	54	51	40

Answers:

$$y = 987.66x^{-0.7}$$

$$r^2 = 0.80$$

Note:

Compare results with those of the example for “Linear regression and correlation coefficient”. Since in that case $r^2 = 0.92 > 0.80$, we know that the linear regression line

$$y = -1.03x + 121.04$$

fits the data points better than the power curve

$$y = 987.66x^{-0.7}$$

88 Curve Fitting

Exponential curve (least squares fit)

Formula:

For a given set of data points

$$\{(x_i, y_i), i = 1, 2, \dots, n\}$$

this algorithm fits an exponential curve of the form

$$y = ae^{bx}$$

$$(a > 0)$$

By writing this equation as

$$\ln y = bx + \ln a$$

the problem can be solved as a linear regression problem (y_i must be positive for all $i = 1, 2, \dots, n$).

Example:

x_i	26	30	44	50	62	68	74
y_i	92	85	78	81	54	51	40

Answers:

$$y = 149.07e^{-0.02x}$$

$$r^2 = 0.89$$

Note:

Compare results with those of the example for “Linear regression and correlation coefficient”. Since in that case $r^2 = 0.92 > 0.89$, we know that the linear regression line

$$y = -1.03x + 121.04$$

fits the data points better than the exponential curve

$$y = 149.07e^{-0.02x}$$

Declining Balance Depreciation

See page 91

Depreciation Amortization

Straight line depreciation

Formulas:

$$D = \frac{PV}{n}$$

$$B_k = PV - kD$$

where PV = original value of asset (less salvage value)

n = lifetime periods of asset

D = each year's depreciation

B_k = book value at time period k

Example:

A fleet car has a value of \$2100 and a life expectancy of six years. Using the straight line method, what is the amount of depreciation and what is the book value after two years?

Answers:

$$D = \$350.00$$

$$B_2 = \$1400.00$$

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	PV	↑	↑					
2	n	÷					D	
3	k	x	-				B _k	

Variable rate declining balance

Formulas:

$$D_k = PV \cdot \frac{R}{n} \left(1 - \frac{R}{n}\right)^{k-1}$$

$$B_k = PV \left(1 - \frac{R}{n}\right)^k$$

where PV = original value of asset

n = lifetime periods of asset

R = depreciation rate (given by user)

D_k = depreciation at time period k

B_k = book value at time period k

Example:

A fleet car has a value of \$2500 and a life expectancy of six years. Use the double declining balance method ($R = 2$) to find the amount of depreciation and book value after four years.

Answers:

$$B_4 = \$ 493.83$$

$$D_4 = \$246.91$$

92 Depreciation Amortization

Sum of the year's digits depreciation (SOD)

Formula:

$$D_k = \frac{2(n - k + 1)}{n(n + 1)} PV$$

$$B_k = S + (n - k) D_k/2$$

where PV = original value of asset

n = life time periods of asset

S = salvage value

D_k = depreciation at time period k

B_k = book value at time period k

Example:

A car has a value (less salvage value – \$800) of \$2100 and a life expectancy of 6 years. Using the SOD method, what is the amount of depreciation and what is the book value after 2 years?

Answers:

$$D_2 = \$500.00$$

$$B_2 = \$1800.00$$

Diminishing balance depreciation

Formulas:

$$D_k = PV_{k-1} \left[1 - \left(\frac{S}{PV_0} \right)^{1/n} \right]$$

$$PV_k = PV_{k-1} - D_k$$

where PV_0 = beginning value of asset

S = salvage value (> 0)

PV_k = book value at time period k ($k = 1, 2, \dots, n$)

D_k = depreciation at time period k

Example:

A car has a value of \$2500, a salvage value of \$400, and a life expectancy of six years. Find the amount of depreciation and book value for each of the first three years by using the diminishing balance method.

Answers:

$$D_1 = \$657.98$$

$$PV_1 = \$1842.02$$

$$D_2 = \$484.81$$

$$PV_2 = \$1357.21$$

$$D_3 = \$357.21$$

$$PV_3 = \$1000.00$$

EQUALLY SPACED POINTS ON A CIRCLE

Given a circle with radius r and center (x_0, y_0) , the routine computes the rectangular coordinates of equally spaced points (x_i, y_i) , $(i = 1, 2, \dots, n)$ on the circle if angle θ and number of points n are known. The position of the first point (x_1, y_1) on the circle is determined by the angle θ .

$$x_{k+1} = x_0 + r \cos \left(\theta + \frac{360}{n} k \right)$$

$$y_{k+1} = y_0 + r \sin \left(\theta + \frac{360}{n} k \right)$$

where $k = 0, 1, 2, \dots, n-1$

Note: θ is in degrees.

Example:

$$(x_0, y_0) = (1, 1)$$

$$\theta = 90^\circ$$

$$r = 1$$

$$n = 4$$

96 Equation Solving (Iterative Techniques)

Answers:

$$(x_1, y_1) = (1, 2)$$

$$(x_2, y_2) = (0, 1)$$

$$(x_3, y_3) = (1, 0)$$

$$(x_4, y_4) = (2, 1)$$

Equation Solving (Iterative Techniques)

Note:

We will deal here with equations of the form

$$x = f(x)$$

for cases where it is difficult to separate all x 's to one side of the equal sign. The iterative approach is illustrated through the solution of selected equations.

Example 1: Find x such that $x = e^{-x}$ *Method:*

Choose $x_a = 5$ as an approximation for the solution. Then after 44 iterations, the answer is $x = 0.567143290$.

Note:

The algorithm will converge to 0.567143290 in about 50 iterations for any value of x_a .

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	5	CHS	e^x	FIX	9		0.006737947	
2		CHS	e^x					Perform 2 forty-three times
3							0.567143290	

Example 2: $4 = x - \frac{1}{x}$ *Method:*

Rewrite the equation as

$$x = \frac{1}{x} + 4.$$

Choose an approximate solution for x , say $x_a = 4$.

Answer:

4.236067978

LINE	DATA	OPERATIONS					DISPLAY	REMARKS

2		$1/x$	4	+				Perform 2 seven times
3							4.236067978	

98 Equation Solving (Iterative Techniques)

Example 3: $x^x = 1000$

Method:

Rewrite the equation in the form

$$x = \ln 1000 / \ln x .$$

Pick an approximation x_a for x , say $x_a = 4$. If we use the following algorithm, convergence is from both sides, and takes a long time.

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1	1000	In ↑ ↑ ↑		
2	4	In ÷ FIX 9	4.982892143	
3		In ÷	4.301189432

8		In ÷	4.588735608	
9		In ÷	4.533824354	
10		In ÷	4.569933525	etc.

To hasten convergence, modify the loop and use the average of the last two approximations as the new approximation.

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1	1000	In ↑ ↑ ↑		
2	4	STO 1 In ÷ RCL		
3		1 + 2 ÷ STO		
4		1	4.491446072	
5		In ÷ RCL + 1		Perform 5–6 twelve times
6		2 ÷ STO 1		
7			4.555535705	

Example 4: Largest x^{x^x}

What is the largest value of x such that x^{x^x} does not overflow in the HP-45 (i.e., $x^{x^x} < 9.999999999 \times 10^{99}$)?

Method:

Since $9.999999999 \times 10^{99}$ is only slightly less than a *googol* (10^{100}), let us call this constant G .

$$\text{Then } x^{x^x} = G$$

$$x^x \ln x = \ln G$$

$$x^x = \ln G / \ln x$$

$$x \ln x = \ln (\ln G / \ln x)$$

$$x = [\ln (\ln G / \ln x)] / \ln x$$

Use 3 as an initial approximation for the solution. The loop in the following algorithm eventually alternates between the last two answers, 3.830482865 and 3.830482864. Upon substitution of both values in x^{x^x} , 3.830482865 gives an overflow. Thus the answer is 3.830482864.

100 Equation Solving (Iterative Techniques)

Example 5: Solve $x^2 + 4 \sin x = 0$

Method:

Rewrite the equation as

$$x = \pm \sqrt{-4 \sin x} \quad (x \text{ is in radians})$$

upon plotting this curve, we see that there is a root near -2 , so take $x_a = -2$ as an approximation of the solution, and substitute in

$$x = - \sqrt{-4 \sin x} .$$

Note:

Since this algorithm converges from both sides, we modified our loop to average two approximations to hasten convergence. It is only necessary to do the loop 5 times to get 4 digits of accuracy.

A method for faster convergence

Some equations $f(x) = 0$ converge very slowly by the above methods, however, the following method gives faster convergence.

Formula:

$$x_{i+1} = x_i - \frac{E_i (x_i - x_{i-1})}{E_i - E_{i-1}}$$

where $i = 1, 2, 3, \dots$

x_i = current trial value

x_{i+1} = next trial value

x_{i-1} = previous trial value

E_i = current error = $f(x_i)$

E_{i-1} = last error = $f(x_{i-1})$

L = lower bound for the solution

U = upper bound for the solution

Example 6: Solve $x^3 = 3^x$ where $1 < x < e$

Method:

Rewrite equation in the form

$$x^3 - 3^x = 0$$

Replace $f(x)$ in the program by

“ \uparrow \uparrow 3 \blacksquare y^x $x \div y$ 3 $x \div y$ \blacksquare y^x $-$ ”

Let $L = 1,$

$U = e.$

Answer:

2.478052679

($E_0 = -2.000000001, E_1 = 0.272546170, E_2 = 0.056084610,$

$E_3 = -0.033421420, E_4 = 0.001191760, E_5 = 0.000022540,$

$E_6 = E_7 = -1 \times 10^{-8}$)

Example 7: Find a root of a polynomial

$$f(x) = x^4 - 4x^3 + 8x^2 + 20x - 65.$$

Method:

Replace $f(x)$ in the program by

“ \uparrow \uparrow \uparrow 4 $-$ \times 8 $+$ \times 20 $+$ \times 65 $-$ ”.

Note that $f(2) = -9 < 0, f(3) = 40 > 0$, so there is a root between 2 and 3.

Let $L = 2$

$U = 3.$

102 Equation Solving (Iterative Techniques)

Answer:

2.236067977 (or $\sqrt{5}$)

($x_0 = 2, x_1 = 3, x_2 = 2.183673469, x_3 = 2.224244398,$
 $x_4 = 2.236236914, x_5 = 2.236067428, x_6 = x_7 = 2.236067977$)

Factorial and Gamma Function

Stirling's approximation

Notes:

This approximation can be used for positive $x \leq 69$ (otherwise the answer is $> 10^{100}$).

This approximation is good for large x .

For $x < 1$, use polynomial approximation.

To compute Gamma Function $\Gamma(x) = (x - 1)!$

Formula:

$$x! \cong \sqrt{2\pi x} x^x e^{-x} \left(1 + \frac{1}{12x} + \frac{1}{288x^2} - \frac{139}{51840x^3} - \frac{571}{2488320x^4} \right)$$

Example:

$$4.25! \cong 35.21$$

110 Factorial and Gamma Function

Polynomial approximation

Notes:

This approximation can be used for positive $x < 69$.

This is a more accurate method (to 6 or 7 decimal places), but longer than Stirling's approximation.

Formula: $x! \cong 1 + b_1x + b_2x^2 + \dots + b_8x^8$

for $0 \leq x \leq 1$

where $b_1 = -.577191652$, $b_2 = .988205891$

$b_3 = -.897056937$, $b_4 = .918206857$

$b_5 = -.756704078$, $b_6 = .482199394$

$b_7 = -.193527818$, $b_8 = .035868343$

Example: $4.25! \cong 35.2116196$

4		R↓	7	÷			686.71429	P = 11
5		R↓	1	1	÷		437.00000	←Q is an integer, so 11 is a factor
6		↑	↑	↑	█	√x	20.90454	P = 11
7		R↓	1	1	÷		39.72727	P = 13
8		R↓	1	3	÷		33.61538	P = 17
9		R↓	1	7	÷		25.70588	P = 19
10		R↓	1	9	÷		23.00000	Q = 23 is a prime, 19 and 23 are factors, stop

Example:

Factor 2909.

Answer:

2909 is a prime.

Fibonacci Numbers

Formula:

In a Fibonacci sequence, each term is the sum of the two preceding terms.

$$f_i = f_{i-1} + f_{i-2}$$

f_i represents the i^{th} term in the sequence.

Example:

Develop the Fibonacci sequence with $f_1 = 1, f_2 = 1$.

Answer:

1, 1, 2, 3, 5, 8, 13, 21, ...

F Statistic

Testing two population variances

Given independent random samples $\{x_i, i = 1, 2, \dots, n_x\}$ and $\{y_i, i = 1, 2, \dots, n_y\}$ taken from two normal populations whose variances are σ_x^2 and σ_y^2 , the F statistic (with $n_x - 1$ and $n_y - 1$ degrees of freedom) can be used to test the null hypothesis

$$H_0: \sigma_x^2 = \sigma_y^2$$

F is computed from the following:

$$F = \frac{s_x^2}{s_y^2}$$

where s_x^2 = sample variance of x
 s_y^2 = sample variance of y

Example:

x: 91, 103, 90, 113, 108, 87, 100, 80, 99, 54 ($n_x = 10$)

y: 79, 84, 108, 114, 120, 103, 122, 120 ($n_y = 8$)

Answer:

F = 1.02 (d.f. = 9 and 7)

Gaussian Quadratures

Gaussian quadrature for $\int_a^b f(x) dx$ or $\int_a^\infty f(x) dx$

Formula:

We estimate the value

$$I_1 = \int_a^b f(x) dx$$

or

$$I_2 = \int_a^{\infty} f(x) dx$$

by the six point Gauss-Legendre quadrature formula,

$$\int_a^b f(x) dx \cong \frac{b-a}{2} \sum_{i=1}^6 w_i f\left(\frac{z_i(b-a) + b+a}{2}\right)$$

$$\text{or } \int_a^{\infty} f(x) dx \cong \frac{1}{2} \sum_{i=1}^6 \frac{4 w_i}{(1+z_i)^2} f\left(\frac{2}{1+z_i} + a - 1\right)$$

where	i	z_i	w_i
	1	.2386191861	.4679139346
	2	-.2386191861	.4679139346
	3	.6612093865	.360761573
	4	-.6612093865	.360761573
	5	.9324695142	.1713244924
	6	-.9324695142	.1713244924

$f(x)$ is any single-valued function and a, b are finite.

Example:

$$\text{Evaluate } \ln 10 = \int_1^{10} \frac{dx}{x}$$

Answer:

2.30 (replace $f(x)$ by “ $\frac{1}{x}$ ”)

Example:

$$\text{Evaluate } \int_e^{e^2} \frac{dx}{x(\ln x)^3}$$

Answer:

0.37 (replace $f(x)$ by “ $\frac{1}{x \ln^3 x}$ ”)

118 Gaussian Quadratures

Example:

$$\text{Evaluate } \Gamma(1.8) = \int_0^{\infty} e^{-x} x^{0.8} dx .$$

Answer:

0.92

(replace f(x) by “ e^x 0.8)

Interpolation

Aiken's formula

Given a set of $n + 1$ data points

$$\{(x_i, y_i), i = 1, 2, \dots, n + 1\}$$

where the x_i are distinct, a unique polynomial $P_n(x)$ of degree n exists which passes through those points.

We generate a table (using Aiken's formula) to evaluate $P_n(x)$ at a given point x_0 .

where

$$y_1^k = [y_k \cdot (x_0 - x_{k+1}) - y_{k+1} \cdot (x_0 - x_k)] / (x_k - x_{k+1})$$

$$k = 1, 2, \dots, n$$

$$y_m^k = [y_{m-1}^k \cdot (x_0 - x_{k+m}) - y_{m-1}^{k+1} \cdot (x_0 - x_k)] / (x_k - x_{k+m})$$

$$m = 2, \dots, n, \text{ and } k = 1, 2, \dots, n+1-m$$

Superscripts of y_m^k denote the index value of the left hand data point used in an interpolation, *subscripts* indicate the degree of the iterated interpolating polynomial at the current stage of the procedure.

Example:

Use Aiken's formula to approximate $P_4(0.25)$ if five data points $(0, 1)$, $(0.1, 1.105171)$, $(0.2, 1.221403)$, $(0.3, 1.349859)$, $(0.4, 1.491825)$ are given.

Answer:

$$x_1 = 0 \quad y_1 = 1$$

$$y_1^1 = 1.262928$$

$$x_2 = 0.1 \quad y_2 = 1.105171 \quad y_2^1 = 1.283667$$

$$y_1^2 = 1.279519 \quad y_3^1 = 1.284030$$

$$x_3 = 0.2 \quad y_3 = 1.221403 \quad y_2^2 = 1.284103 \quad y_4^1 = 1.284026 = P_4(0.25)$$

$$y_1^3 = 1.285631 \quad y_3^2 = 1.284023$$

$$x_4 = 0.3 \quad y_4 = 1.349859 \quad y_2^3 = 1.283942$$

$$y_1^4 = 1.278876$$

$$x_5 = 0.4 \quad y_5 = 1.491825$$

130 Interpolation

Linear interpolation

Assume $f(x)$ is a function of x , for given $x_1, x_2, f(x_1), f(x_2)$ and $x_1 < x_0 < x_2$, we can approximate $f(x_0)$ by

$$f(x_0) = \frac{(x_2 - x_0) f(x_1) + (x_0 - x_1) f(x_2)}{x_2 - x_1}$$

Example:

Suppose a table shows

x	f(x)
1.2	0.30119
1.3	0.27253

Interpolate f to 5 decimal places for $x = 1.27$.

Answer:

0.28113

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	x_2	STO	1					
2	x_0	STO	2	-				
3	$f(x_1)$	x	RCL	2

5	$f(x_2)$	x	+	RCL	1	RCL		
6		3	-	÷				

Intersections of Straight Line and Conic

Formula:

Find the intersections $(x_1, y_1), (x_2, y_2)$ of the equations

$$ax + by + c = 0 \tag{1}$$

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \tag{2}$$

if there are any real intersections.

We can solve equation (1) for x (if $a \neq 0$), then substitute in equation (2) and solve the new quadratic equation in y (this program does not work if the new equation in y is linear or constant, in that case display will show flashing zeros).

Example:

Find intersections of

$$2x - y - 2 = 0$$

and

$$4x^2 + 16y^2 - 8x - 32y - 44 = 0$$

Answers:

$$(x_1, y_1) = (2.43, 2.87), (x_2, y_2) = (0.51, -0.98) \quad (Q = 3.71)$$

Negative Binomial Distribution

Formula:

$$f(x) = \binom{-r}{x} p^r (1-p)^x = \binom{r+x-1}{x} p^r (1-p)^x$$

where $x = 0, 1, 2, \dots$

$r = 1, 2, \dots$

$0 \leq p \leq 1$

Example:

If $r = 4, p = 0.9$ then

$f(0) = 0.66$

$f(1) = 0.26$

$f(2) = 0.07$

Normal Distribution

See page 115

Numerical Integration

Method:

To approximate the area A under a curve, sum the areas of the constituent trapezoids of width I . Each trapezoid has the area

$$I \times \frac{y_i + y_{i-1}}{2}$$

Example:

Find the area bounded by

$$y = x^2 + 2x - 3,$$

$$x = -2,$$

$$x = 0 \text{ (the y axis)}$$

and

$$y = 0 \text{ (the x axis).}$$

152 Numerical Integration

In this case

$$x_0 = -2, x_n = 0, n = 4, I = 0.5$$

Replace $f(x)$ by “ \uparrow \uparrow \uparrow 2 $+$ \times 3 $-$ ”

Answer:

7.25

Percent

Markup percent

Formula:

To make a gross profit of $G\%$, add $A\%$ to the cost price. To find A for a given G .

$$A = \frac{100G}{100 - G}$$

Example:

To make a profit of 30% , what is the percentage of markup?

Answer:

42.86%

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	G	$\frac{1}{x}$	EEX	CHS	2	-		
2		$\frac{1}{x}$						

Gross % profit

Formula:

If $A\%$ is added to the cost price, the profit will be $G\%$ of the selling price.

$$G = \frac{100A}{A + 100}$$

Example:

If we add 30% to our cost price, what percent of the selling price will be the profit?

Answer:

23.08%

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	A	$\frac{1}{x}$	EEX	CHS	2	+

Quadratic Equation

Formula:

The roots of $Ax^2 + Bx + C = 0$
are

$$\frac{-B \pm \sqrt{B^2 - 4AC}}{2A}$$

If $D = (B^2 - 4AC)/4A^2$ is positive, the roots are real. The root with larger absolute value x_1 is computed first to obtain better significance. The second real root x_2 is found by

$$x_2 = \frac{C}{Ax_1}$$

If D is negative, roots are complex (one root is the complex conjugate of the other), being

$$u \pm iv = \frac{-B}{2A} \pm \frac{\sqrt{4AC - B^2}}{2A} i$$

Example 1:

Solve $3.142958x^2 - 6.987122x + 1.001976 = 0$

Answers: $x_1 = 2.07, x_2 = 0.15$

$$\left(D = 0.92, \frac{-B}{2A} = 1.11 \right)$$

Example 2:

Solve $-7.23x^2 + 2.67x - 3.17 = 0$

Answers: $u \pm iv = 0.18 \pm 0.64i$

$$(D = -0.40)$$

Radians to Degrees

See page 19

Random Numbers

Objective:

This routine will use a "seed" S to generate a sequence of pseudo random numbers R_i in either of two ranges -1 to 0 (if $S < 0$) or 0 to 1 (if $S > 0$). For best results, the seed must be a ten digit decimal fraction containing all digits 0 through 9 in an arbitrary order.

Example:

If $S = .2510637948$, generate a random series.

Answers:

0.28, 0.14, 0.19, 0.65, 0.90, 0.20, 0.85, etc.

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1		2	9	↑	↑	↑		
2	s							
3		x					D_i	Perform 3-4 for $i=1,2,3,\dots$
4	f_i	-					R_i	Let f_i = integer part of D_i

Rank Correlation (Spearman's Coefficient)

Formula:

$$r_s = 1 - \frac{6 \sum_{i=1}^n D_i^2}{n(n^2 - 1)}$$

where n = number of paired observations (x_i, y_i)

$$D_i = \text{rank}(x_i) - \text{rank}(y_i) = R_i - S_i$$

166 Rank Correlation (Spearman's Coefficient)

If the X and Y random variables from which these n pairs of observations are derived are independent, then r_s has a mean of zero and a variance

$$\frac{1}{n-1}$$

An approximate test for the null hypothesis

Ho: X, Y are independent

is

$$Z = r_s \sqrt{n-1}$$

which is approximately a standardized normal variable (for large n, say $n \geq 10$).

If the null hypothesis of independence is not rejected, we can infer that the population correlation coefficient $\rho(x, y) = 0$, but dependence between the variables does not necessarily imply that $\rho(x, y) \neq 0$.

Note: $-1 \leq r_s \leq 1$

Example:

Student	X Math Grade	Y Stat Grade	R Rank of X	S Rank of Y
1	82	81	6	7
2	67	75	14	11
3	91	85	3	4

Resistance

Formula:

The equivalent resistance R of a parallel combination of resistors is

$$R = \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \dots + \frac{1}{R_n}}$$

Example:

Find R.

Answer:

$$R = 3.00$$

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1	R_1	$1/x$ [] [] [] []		
2	R_2	$1/x$ + [] [] [] []		Perform 2 for $i=2, \dots, n$
3		$1/x$ [] [] [] []		

Roots of a Polynomial

Formula:

The Newton-Raphson iterative method can be used to compute a root of the polynomial equation

$$f(x) \equiv a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n = 0$$

by using

$$x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)}$$

where f' is the derivative of f .

Due to storage limitations, the following key sequence is limited to handling polynomials with $n \leq 9$. The routine can be modified (to record intermediate results instead of storing them) to solve polynomials with $n > 9$.

Example:

Given an initial estimate $x_0 = 0.6875$ of a zero of the polynomial

$$f(x) = x^3 - 11x^2 + 32x - 22$$

improve the estimate so that it is accurate to the 5th decimal place.

Answer:

$$x_1 = 0.95396, x_2 = 0.99875, x_3 = x_4 = 1.00000$$

Simultaneous Linear Equations**Two unknowns***Formula:*

Solve for x and y

$$\begin{cases} ax + by = e \\ cx + dy = f \end{cases}$$

Determinant solutions are:

$$x = \frac{\begin{vmatrix} e & b \\ f & d \end{vmatrix}}{D}$$

$$y = \frac{\begin{vmatrix} a & e \\ c & f \end{vmatrix}}{D}$$

where

$$D = \begin{vmatrix} a & b \\ c & d \end{vmatrix} \neq 0.$$

Example:

$$\text{Solve } \begin{cases} 7.32x - 9.08y = 3.14 \\ 12.39x + 7y = 0.05 \end{cases}$$

Answers:

$$x = 0.14$$

$$y = -0.24$$

$$(D = 163.74)$$

Three unknowns

Formulas:

$$\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$$

Determinant solution to these simultaneous equations:

$$x = \frac{\begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}}{D}$$

$$y = \frac{\begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}}{D}$$

$$z = \frac{d_1 - b_1y - a_1x}{c_1}$$

where

$$D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \neq 0$$

178 Simultaneous Linear Equations

Example:

Solve

$$\begin{cases} 3.14x + 10.02y - 7z = 1 \\ 0.25x + 30.3y - 9.1z = 2 \\ -3.5x + 27.4y + 8z = 3 \end{cases}$$

Answers:

$$x = 0.29$$

$$y = 0.11$$

$$z = 0.14$$

$$(D = 1052.86)$$

Skewness and Kurtosis

(for grouped or ungrouped data)

Formulas:

mean:

$$\bar{x} = \frac{1}{n} \sum x_i$$

2nd moment:

$$m_2 = \frac{1}{n} \sum x_i^2 - \bar{x}^2$$

3rd moment:

$$m_3 = \frac{1}{n} \sum x_i^3 - \frac{3}{n} \bar{x} \sum x_i^2 + 2\bar{x}^3$$

4th moment:

$$m_4 = \frac{1}{n} \sum x_i^4 - \frac{4}{n} \bar{x} \sum x_i^3 + \frac{6}{n} \bar{x}^2 \sum x_i^2 - 3\bar{x}^4$$

Skewness:

$$\gamma_1 = \frac{m_3}{m_2^{3/2}}$$

182 Skewness and Kurtosis

Kurtosis (excess):

$$\gamma_2 = \frac{m_4}{m_2^2} - 3$$

Example 1: Ungrouped data

i	1	2	3	4	5	6	7	8	9
x_i	2.1	3.5	4.2	6.5	4.1	3.6	5.3	3.7	4.9

Answers:

Speedometer/Odometer Adjustments

Objective:

Assume that you are an automobile passenger approaching a speedometer test section with an HP-45 in your hand. You want to calculate

TS – true speed of the car

RS – what your speedometer will register at a posted speed

DS – distance traveled after a trip

RO – the reading of the odometer after a specific distance d

184 Speedometer/Odometer Adjustments

Notation:

a_1 = mileage read at beginning of trip

a_2 = mileage read at end of trip

b_1 = mileage read at beginning of test section (to nearest 20th of a mile, if possible)

b_2 = mileage read at end of test section

L = length of test section

s = speedometer value

p = posted speed

q = present milage

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	b_1	CHS	↑					
2	b_2	+						
3	L	÷	STO	1				
4							For TS, go to 5 For RS, go to 6 For DS, go to 7 For RD, go to 9	
5	s	RCL	1	÷			TS Go to 4	
6	p	RCL	1	x			RS Go to 4	
7	a_2	↑						
8	a_1	-	RCL	1	÷		DS Go to 4	
9	d	RCL	1	x				
10	q	+					RD Go to 4	

Example:

Assume the following:

a_1 = 2185.2 Mileage at start of trip

b_1 = 2219.4 Mileage at start of test section

b_2 = 2224.15 Mileage at end of test section

L = 5 miles Length of test section

1. How fast is the car actually traveling when the speedometer registers
(a) 50 mph? (b) 70 mph? (c) 30 mph?
2. What will the speedometer register if the true speed is (a) 65 mph?
(b) 55 mph?
3. When the odometer reads 2236.3, how many miles have you traveled
since the start of your trip.
4. You see a sign saying "DOEVILLE 48". If your odometer now reads
2241.5, what will it register when you arrive at DOEVILLE?

Navigational course

The above routine can be used to find the great circle route a and the true course C if the coordinates of the source (ϕ_s, θ_s) and destination (ϕ_D, θ_D) are known.

S = Source

D = Destination

Notes:

1. $A = \theta_s - \theta_D$, $b = 90^\circ - \phi_s$, $c = 90^\circ - \phi_D$
2. Northern hemisphere latitudes and Western hemisphere longitudes are indicated as positive numbers, Southern and Eastern coordinates are indicated as negative numbers.
3. 1° (spherical coordinate) = 60 nautical miles
4. True course = $360^\circ - C$ if $\sin A < 0$ (i.e., going west).

188 Spherical Triangle

Example:

Find the great circle distance and true course from San Francisco (37° 37' N, 122° 23' W) to Monterey (36° 35' N, 121° 51' W).

Answers:

Distance = 67.05 nautical miles

True course = 157.46°

Stack Operations

See page 168

Stirling's Approximation

See page 109

Synthetic Division

Formula:

This program performs synthetic division on a polynomial of degree n (with real coefficients)

$$a_n X^n + a_{n-1} X^{n-1} + \dots + a_1 X + a_0$$

by $x - x_0$ so that

$$\frac{a_n X^n + \dots + a_1 X + a_0}{x - x_0} = b_{n-1} X^{n-1} + b_{n-2} X^{n-2} + \dots + b_1 X + b_0 + \frac{R}{x - x_0}$$

Example:

Divide $x^5 - 4x^4 + 7x^3 - 10x^2 + 8$ by $x - 2$.

Answer:

$$(x^4 - 2x^3 + 3x^2 - 4x - 8) + \frac{(-8)}{x - 2}$$

6	a_0	+					R	

Triangles (Oblique)

The basic formulas used to solve a triangle are:

1. law of sines

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

2. law of cosines

$$c^2 = a^2 + b^2 - 2ab \cos C$$

Note: Triangle solution routines work in any angular mode. When the calculator is in DEG mode, all angles are in decimal degrees.

Given a, b, C; find A, B, c

Formulas:

$$c = \sqrt{a^2 + b^2 - 2ab \cos C}$$

$$A = \tan^{-1} \left(\frac{a \sin C}{b - a \cos C} \right)$$

$$B = \cos^{-1} [-\cos (A + C)]$$

Example:

Given $b = 224$
 $C = 28^\circ 40'$
 $a = 132$

Find c, A, B

(*Note:* C must be converted to decimal degrees before calculation.)

Answer:

$c = 125.35$
 $A = 30.34^\circ$
 $B = 120.99^\circ$

LINE	DATA	OPERATIONS	DISPLAY	REMARKS

Given a, b, C; find area

Formula:

$$\text{area} = \frac{1}{2} a b \sin C$$

Example:

$$\text{If } a = 5.3174,$$

$$b = 7.0898$$

$$C = \frac{\pi}{4}$$

Answer:

$$\text{area} = 13.33$$

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1	a	↑		
2	b	x 2 ÷		Set machine to any desired mode (DEG, RAD, or GRD).
3	C	SIN x		

Given a, B, C; find area
Formula:

$$\text{area} = \frac{a^2}{2} \frac{\sin B \sin C}{\sin (B + C)}$$

Example:

$$\text{If } B = 70^\circ 32' 12''$$

$$C = 62^\circ 57' 28''$$

$$a = 14.625$$

Answer:

$$\text{area} = 123.80$$

Note:

In this example, convert angles to decimal degrees before using trigonometric function keys.

T Statistics

t for paired observations

Formulas:

Given a set of paired observations:

x_i	x_1	x_2	x_3	...	x_n
y_i	y_1	y_2	y_3	...	y_n

let $D_i = x_i - y_i$

$$\bar{D} = \frac{1}{n} \sum_{i=1}^n D_i$$

$$S_D = \sqrt{\frac{\sum D_i^2 - \frac{(\sum D_i)^2}{n}}{n - 1}}$$

$$S_{\bar{D}} = \frac{S_D}{\sqrt{n}}$$

test statistic

$$t = \frac{\bar{D}}{S_{\bar{D}}}$$

Example:

Compute t for the following:

x_i	14	17.5	17	17.5	15.4
y_i	17	20.7	21.6	20.9	17.2

Answer:

$$t = -7.16$$

5		<input type="text" value="5"/>	<input type="button" value="√x"/>	<input type="button" value="x"/>	<input type="text"/>		

206 T Statistics

t for population mean

Formula:

Suppose $\{x_1 \dots x_n\}$ is a random sample from a normal population (mean μ and variance are unknown).

$$\bar{x} = \frac{1}{n} \sum x_i$$

$$S_x = \left(\frac{\sum x_i^2 - n\bar{x}^2}{n - 1} \right)^{1/2}$$

$$t = \frac{\bar{x} - \mu_0}{S_x}$$

Degrees of freedom = $n - 1$

We can use this t statistic to test the null hypothesis $H_0: \mu = \mu_0$.

Example:

Compute t from the sample:

$$\{2.1, 0.5, -3.1, 1.4, -0.92, -1.35, 1.2\}$$

for testing $H_0: \mu = 0.2$.

Answer:

$t = -0.12$
(6 degrees of freedom)

LINE	DATA	OPERATIONS	DISPLAY	REMARKS
1		<input type="button" value="CLEAR"/> <input type="text"/> <input type="text"/> <input type="text"/>		
2	x_i	<input type="button" value="Σ+"/> <input type="text"/> <input type="text"/> <input type="text"/>		Perform 2 for $i=1,2,\dots,n$
3		<input type="button" value="x̄,s"/> <input type="text"/> <input type="text"/> <input type="text"/>		
4	μ_0	<input type="button" value="-"/> <input type="button" value="x̄÷y"/> <input type="text"/> <input type="text"/>		

t for correlation coefficient

Formula:

$$t = \frac{r \sqrt{n - 2}}{\sqrt{1 - r^2}}$$

where n = sample size

r = estimate of the correlation coefficient.

This t statistic has n - 2 degrees of freedom and can be used to test the null hypothesis that the correlation coefficient ρ is zero.

$$H_0: \rho = 0$$

Example:

x_i	26	30	44	50	62	68	74
y_i	92	85	78	81	54	51	40

n = 7

r = -0.96 (See Covariance and Correlation Coefficient)

Answer:

t = -7.67

(Degrees of freedom = 5)

LINE	DATA	OPERATIONS					DISPLAY	REMARKS
1	r	STO	1					
2	n	↑	2	-		\sqrt{x}		
3		x	1	RCL	1	x^2		
4		-		\sqrt{x}	÷		t	

t for two sample means

Formula:

Suppose x_1, x_2, \dots, x_{n_1} and y_1, y_2, \dots, y_{n_2} are samples from normal populations with means μ_1 and μ_2 , both with variance σ^2 (unknown).

$$t = \frac{\bar{x} - \bar{y} - d}{\sqrt{\frac{1}{n_1} + \frac{1}{n_2}} \sqrt{\frac{\sum x_i^2 - n_1 \bar{x}^2 + \sum y_i^2 - n_2 \bar{y}^2}{n_1 + n_2 - 2}}}$$

where

$$\bar{x} = \frac{1}{n_1} \sum x_i \quad \bar{y} = \frac{1}{n_2} \sum y_i$$

We can use this t to test the null hypothesis

$$H_0: \mu_1 - \mu_2 = d$$

t has $n_1 + n_2 - 2$ degrees of freedom.

Example:

x: 79, 84, 108, 114, 120, 103, 122, 120 ($n_1 = 8$)

y: 91, 103, 90, 113, 108, 87, 100, 80, 99, 54 ($n_2 = 10$)

Answer:

If $d = 0$, then $t = 1.73$

degrees of freedom = 16

210 Vector Operations

Vector angles

Suppose

$$\vec{x} = (x_1, x_2, x_3)$$

$$\vec{y} = (y_1, y_2, y_3)$$

then the angle between these two vectors is

$$\theta = \cos^{-1} \left[\frac{x_1 y_1 + x_2 y_2 + x_3 y_3}{\sqrt{x_1^2 + x_2^2 + x_3^2} \sqrt{y_1^2 + y_2^2 + y_3^2}} \right]$$

Example:

Find the angle between

$$\vec{x} = (5, -6.2, -7),$$

$$\vec{y} = (3.15, 2.22, -0.3)$$

Answer:

$$\theta = 84.28 \text{ degrees} = 1.47 \text{ radians} = 93.64 \text{ grads.}$$

8		RCL	6	RCL	4	x		
9		RCL	1	RCL	5	x		
10		-					z_3	

212 Vector Operations

Vector dot product

Formulas:

Given two vectors \vec{x}, \vec{y} in an n-dimensional vector space

$$\vec{x} = (x_1, x_2, \dots, x_n)$$

$$\vec{y} = (y_1, y_2, \dots, y_n)$$

the dot product is

$$\vec{x} \cdot \vec{y} = x_1y_1 + x_2y_2 + \dots + x_ny_n$$

Example:

If $\vec{x} = (2.34, 5.17, 7.43, 9.11, 11.41)$

$$\vec{y} = (.072, .231, .409, .703, .891)$$

then $\vec{x} \cdot \vec{y} = 20.97$

See page 202

Weekday

Day of the week for any date since September 14, 1752

d = day of month

m = month, with January and February being the 13th and 14th months of the previous year.

y = year (4 digits)

$$\text{Weekday} = d + n_1 + n_2 - n_3 + n_4 \pmod{7}$$

where $n_1 = \text{Int}\left(\frac{13}{5}(m+1)\right)$

$$n_2 = \text{Int}\left(\frac{5}{4}y\right)$$

$$n_3 = \text{Int}\left(\frac{y}{100}\right)$$

$$n_4 = \text{Int}\left(\frac{y}{400}\right)$$

Int is "integer part of".

Output is read as follows:

0 – Saturday

1 – Sunday

2 – Monday

3 – Tuesday

4 – Wednesday

5 – Thursday

6 – Friday

Example:

On what day was February 29, 1972?

Answer:

Tuesday ($d = 29, m = 14, y = 1971$)

Appendix

Questions you may have wanted answered about your HP-45.

1. **Question:** What are the maximum and minimum light displays on the HP-45?

Answer: Maximum: $\pm 8.888888888 \pm 88$ after all decimal points light up on low battery power.

Minimum: •

2. **Question:** A googol is 10^{100} . We can key this in as 10×10^{99} on the HP-45, right? Its reciprocal can be keyed in as $.1 \times 10^{-99}$, right?

Answer: Wrong. 10 $99 \rightarrow 9.999999999$ 99
 $.1$ $99 \rightarrow 0.00$

3. **Question:** The display is blanked out during computation. Is the keyboard also locked out?

Answer: Yes

4. **Question:** What calculation takes the longest response on the HP-45?

Answer: $99!$ It's about 2 seconds.

or of 9.999999999 99 . It's about 2 seconds.

5. **Question:** Do 1 2 3 . Now if we press or (that is $\frac{3}{0}$ or 0^3) which will result in flashing zeros, will the stack be dropped?

Answer: Yes for $\frac{3}{0}$: $\rightarrow 2.00$ $\rightarrow 1.00$ $\rightarrow 1.00$

No for 0^3 : $\rightarrow 3.00$ $\rightarrow 2.00$ $\rightarrow 1.00$

6. **Question:** Suppose we pressed the gold key by mistake. Which key will cancel it, causing no other operations?

Answer: Any one of $\boxed{1}$, $\boxed{2}$, $\boxed{3}$, $\boxed{4}$, $\boxed{5}$, $\boxed{6}$.

7. **Question:** Do: 6 $\boxed{\text{EEX}}$ 16. How can we make the whole number negative?

Answer: $\boxed{x\bar{z}y}$ $\boxed{x\bar{z}y}$ $\boxed{\text{CHS}}$

8. **Question:** How can three successive $\boxed{\text{TAN}}$ presses be used to calculate the tangent of 30° (accurate to about 7 decimal places)?

Answer: 30 \blacksquare $\boxed{\text{DEG}}$ \blacksquare $\boxed{\text{TAN}}$ \blacksquare $\boxed{\text{TAN}}$ \blacksquare $\boxed{\text{TAN}}$ $\rightarrow 0.58$

9. **Question:** When may it be desirable to press $\boxed{\text{CLX}}$ if the display is already zero?

Answer: When we get zero as the result of an operation, but don't want to raise it in the stack upon entering data.

10. **Question:** When may it be desirable to enter 0 if x is already zero?

Answer: If an algorithm requires the integer part of a number (already in the X register) such as 0.41, we would do: $\boxed{\text{CLX}}$ 0, which would insure that this zero would be raised in the stack, if the algorithm requires it.

11. **Question:** Enter any three digits in the form $d.dd \times 10^{-7}$:

$d.dd$ $\boxed{\text{EEX}}$ $\boxed{\text{CHS}}$ 7.

How do you add 1 to this number with one keystroke? Your number now has the form $1.000000ddd$, how do you subtract 1 from it with one keystroke?

Answer: $\boxed{e^x}$ and $\boxed{\ln}$ (All this means is that $\ln(1 + A)$ approaches A as A approaches 0.)

12. **Question:** What numbers will the HP-45 not give reciprocals to?
- Answer:** 0 and any number with an exponent of +99 having a value other than ± 1 .
13. **Question:** How many decimal points light up on low battery power?
- Answer:** Only 14; the point following the true decimal point does not come on!
14. **Question:** To divide x by 2: $\boxed{\uparrow} 2 \boxed{\div}$. What other keystrokes will do the same?
- Answer:** $\boxed{e^x}$ $\boxed{\blacksquare}$ $\boxed{\sqrt{x}}$ $\boxed{\ln}$ for $|x| \leq 227$.
15. **Question:** $9 \boxed{\uparrow} 8 \boxed{\div} \boxed{\text{CHS}} \boxed{\text{EEX}} 97 \boxed{\times} \boxed{1/x} \boxed{\blacksquare} \boxed{\text{SCI}} 9$
 $\rightarrow -8.888888889-98$
- Change this number to $-8.888888888-98$ in a shorter number of keystrokes than keying in the new value. (Note: we must add 1×10^{-107} to the number in the display. If we try to add $.000000001 \times 10^{-98}$, we also get into trouble.)
- Answer:** $\boxed{\text{EEX}} 98 \boxed{\uparrow} \boxed{\text{EEX}} 89 \boxed{-} \boxed{1/x} \boxed{+} \boxed{\text{EEX}} \boxed{\text{CHS}} 98 \boxed{-}$
16. **Question:** How would you display the number $e(2.718281828)$:
- (a) in the shortest number of keystrokes? (2 keystrokes)
- (b) as the limit of $\left(1 + \frac{1}{n}\right)^n$ as n gets large? (9 keystrokes)
- (c) as the function of a digit? (6 keystrokes)
- (d) using the $\boxed{\pi}$ key, but not $\boxed{e^x}$
 or $\boxed{y^x}$? (14 keystrokes)
- (e) as a continued fraction? (21 keystrokes)
- (Press $\boxed{\text{FIX}} \boxed{9}$ to see the whole number.)

16. Cont'd

Answer: (a) 1 e^x (b) EEX 6 \uparrow $\frac{1}{x}$ 1 $+$ $x \rightarrow y$ y^x (c) 5 e^x 5 $\frac{1}{x}$ y^x (d) π \uparrow ln \div \uparrow ln \div \uparrow ln \div
 \uparrow ln \div (e) 18 $\frac{1}{x}$ 14 $+$ $\frac{1}{x}$ 10 $+$ $\frac{1}{x}$ 6 $+$ $\frac{1}{x}$
1 $+$ $\frac{1}{x}$ 2 \times 1 $+$

17 Question: Can you display all ten L.E. D. digits in an orderly sequence?

Answer: 80 \uparrow 81 \div FIX 9 \rightarrow 0.98765432118. Question: Determine the Golden Ratio ϕ to 11 significant digits, given

$$\phi = \frac{(\sqrt{5} + 1)}{2} \text{ and } \phi - \frac{1}{\phi} = 1.$$

Answer: 5 \sqrt{x} 1 $+$ 2 \div SCI 9 \rightarrow 1.618033989 \uparrow $\frac{1}{x}$ \rightarrow 6.180339887-01 $-$ FIX 2 \rightarrow 1.00

$$\phi = 1.6180339887$$
