HP 81 OPERATING GUIDE

Part No. 00081-90000

Page 112:

Please add a note indicating that the California and Texas offices are not available for HP 81 service.

Changes

HP-81 OPERATING GUIDE Manual Part No. 00081-90000

Pages 48, 55, 56, 58. Add this NOTE to each page:

If your HP-81 has Option 002 or 003 (Buffered Keyboard), keying in another operation causes the calculator to halt the amortized loan schedule or depreciation schedule.

Page 97. Change the 'Spare Fuses' information to this:

DESCRIPTION	-hp- PART NUMBER
SPARE FUSE (one supplied):	
½A, slo-blo (120V operation)	2110-0202
¼A, slo-blo (240V operation)	2110-0201

Page 126. Add this NOTE to the "30-day Mode" section:

When the timeperiod is greater than one month and the final date is the 31st of a month:

To have results conform to the 30-day convention which assumes that a final date of the 31st of a month and the 1st of the next month are the same day, you should either add one day to the specified final date or add one day to the calculated number of days.

Also, see the blue change sheet at the back of your operating guide.

MODEL 81

HEWLETT-PACKARD

OPERATING GUIDE

Copyright by Hewlett-Packard Company 1973

HEWLETT-PACKARD CALCULATOR PRODUCTS DIVISION
P.O. Box 301, Loveland, Colorado 80537, Tel. (303) 667-5000
Rue du Bois-du-Lan 7, CH-1217 Meyrin 2, Geneva, Tel. (022) 41 54 00

Introduction

The HP-81 is already pre-programmed with many commonly-used financial tables and is ready to solve any of these business problems:

- All types of simple and compounded interest calculations
- Percentage calculations
- Statistical applications (mean and standard deviation)
- Present value, future value, and effective rate calculations
- Sum-of-the-digits amortization (finance charges, depreciation)
- Add-on interest to effective annual rate conversion
- Effective yield calculations
- Mortgage calculations
- Discounted cash-flow analysis
- Bond price and yield-to-maturity calculations
- Time interval and future date calculations
- Linear regression analysis (trend line forecasting)
- Square root and common log calculations

Also, these extended business functions are available for your use:

- Interest per period
- Discounted rate of return
- Declining-balance depreciation schedule
- Diminishing-balance depreciation schedule
- Sum-of-the-digits depreciation schedule
- Rule-of-78's prepayment
- Amortized loan schedule
- Odd-days interest
- Coupon-equivalent yield
- Percent of total

In addition to the many business-related functions, the HP-81 is fast, accurate, and convenient to use. It handles numbers up to 10^{100} (that's 1 followed by 100 zeros) and down to 10^{-99} (that's a decimal point followed by 98 zeros and a 1). It automatically places the decimal point (if you wish), allows you to round numbers to from zero to six decimal places, and provides you with a special alphanumeric, impact printer that produces an easy-to-read, permanent record. Of course, the HP-81 does everything a conventional four-function desk calculator does, too.

Using This Guide

Once you've unpacked the HP-81, take a few moments to read parts of this Guide to find out why your new calculator is different from all the rest. After making the simple checks on page 1, read the rest of Chapter 1 as you get acquainted with the HP-81's basic features. You'll need to know those Basic Instructions to get the most from your new calculator.

Next, use the Chapter Index to the right to find the HP-81 functions that will solve your business or financial problems. You are invited to try the example problem which accompanies each function.

After becoming acquainted with the HP-81, you may find that the accessory Quick Reference (look under the calculator's top-cover) is all that's needed when solving most problems. For your convenience the Quick Reference is organized, chapter-by-chapter, just like the Operating Guide.

KEYBOARD LEGEND

Power switch.

Erases the present calculation, the operational stack (see **SAVE↑** below), and the statistics storage registers (see page 7).

Erases the number just keyed in.

When switched *on* (up), automatically enters a decimal point with each number entry.

Use like a typewriter 'shift' key to perform the HP-81 alternate functions shown in green.

The HP-81 has four temporary storage locations (number lines) arranged as shown to the left.

All numbers go into the **X**-line first — the only line printed or displayed. Pressing **SAVE↑** copies the **X**-line number into the **Y**-line and moves the other line numbers up similarly. The original **T**-line number is lost.

Changes the sign (to positive or negative) of the number in the **X**-line.

Stores an entry from the **X**-line into the designated storage register.

Recalls the number from the designated storage register back to the **X**-line.

'Rolls down' the numbers in the operational stack (the original **X**-line number is moved to the **T**-line).

Exchanges the contents of the **X**- and **Y**-lines.

Prints the **X**-line number (necessary for addition, subtraction, percent and percent difference calculations). It does not affect any calculation or the operational stack.

Prints the result of calculations and clears the operational stack.

Switches the printer OFF.

Advances the printer paper.

Switching On

Your HP-81 is shipped fully assembled and ready to operate, but first make these simple checks:

- If you have just received your HP-81, immediately inspect it and switch it ON by following the instructions in Appendix A. But if the HP-81 has been running in your area, read on:
- If the calculator is not plugged in, plug one end of the power cord into the rear panel of the calculator; plug the other end into a suitable power outlet.
- If the calculator is switched off, check to see that the **PRT OFF** switch is in the *up* position and the **DECIMAL** switch is in the *down* position (they will be explained soon). Now press and lock **POWER OFF** *down*; the word 'CLEAR' should be printed — if not, see Appendix C.

The Keyboard

The HP-81 keyboard layout and legend are shown on the facing page. Almost every key performs two distinct functions: the symbol for the primary function appears on the key-top; the symbol for the alternate function appears in green on the key-front.

To use the primary function, merely press the selected key. To use the alternate function, press the  key immediately before pressing the selected key.

The Printer

The printer provides a written record of all calculations, using an easy-to-understand notation for each function. In addition, the HP-81 prints various messages. Some of these indicate calculator status, while others tell you of illegal operations, such as dividing by zero. You'll find a list of 'error messages' at the back of this Guide and under the calculator top-cover.

Display Option

With the display option installed, you should see a display of **0.00** when you switch the HP-81 ON. Numbers keyed in and the results of all calculations appear in the display. Press  when you need to retain a particular result. And to conserve paper, press **PRT OFF** *down* to shut-off the printer.

Entering Numbers

Number keys are arranged conveniently as on an adding machine. Key in numbers from left to right and include the decimal point if it is a part of the number. For example, 94.125 would be keyed in as:

To check the number just keyed in, press . The small light in the display window simply indicates that the machine is doing an operation, in this case PRINT, and that the keyboard is inoperative while the machine is busy.

Before keying in a second number, save the first by pressing . Now key in the next number.

Clearing

If you find that you have made a mistake when keying in a number, erase the entire number by pressing . Then key in the number correctly. To ready the HP-81 for a new problem, press . This is not always necessary, but it's reassuring! The operations that require initial 'clearing' are mentioned as they appear in this Guide.

If you wish to clear the entire calculator, including all stored data, switch the HP-81 OFF and then ON.

Arithmetic Operations

To add, subtract, multiply or divide:

- 1) Key in the first number, press **SAVE**↑

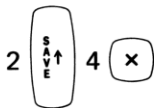

- 2) Key in the second number, press , , , or .

The answer is calculated *and* printed (and displayed) for multiplication and division, but only calculated (and displayed) for addition and subtraction — this is to allow *chain calculations* where a series of numbers are entered and added to each other. To print addition and subtraction results, press .

Examples:

A. Find 2×4

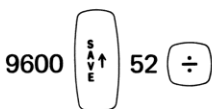

Enter:

2.00	↑
4.00	×
8.00	◊

B. Find $9600 \div 52$

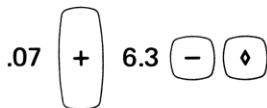

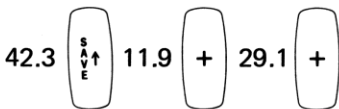

Enter:

9600.00	↑
52.00	÷
184.62	◊

C. Find $42.3 + 11.9 + 29.1 + .07 - 6.30$

Enter:

42.30	↑
11.90	+
29.10	+
.07	+
6.30	-
77.07	◊

Negative Numbers

To enter a negative number, key in its value and press **CHS**.

To change the sign of the current answer, just press **CHS**.

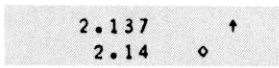

All negative numbers are printed in red.

Rounding Numbers

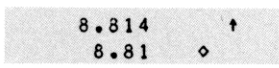

When the HP-81 is switched ON, printed (and displayed) numbers are automatically rounded to two decimal places. To change the rounding format, simply press  and any number key from  to .

For example, when the HP-81 is in two-decimal-place format:

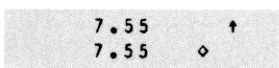

Entering 2.137 results in:

Entering 8.814 results in:

But entering 7.55 results in:

If  ,  , or   is pressed, numbers will be printed and displayed in *scientific notation*. This is a shorthand way of expressing very large or very small numbers. It uses a base number multiplied by 10 to a power.

For example:

$$92,500 = 9.25 \times 10^4 =$$

$$.0025 = 2.5 \times 10^{-3} =$$

The rounding format does not generally apply to the internal calculations, only to printed (and displayed) numbers.

In several calculations, however, the number and rounding format *does* affect the internal calculations. These include payment and depreciation schedules, rebate calculations, and accumulated interest calculation, where the periodic amounts must be payable in even monetary units.

Automatic Decimal Point

The  key is used in conjunction with the rounding format so that a decimal point is entered automatically at the specified position. For example, when the HP-81 is in the two-decimal-place format and the  key is *up* (on), a decimal point is entered automatically before the final two digits.

When the **DECIMAL** key is *down* (off), the decimal point must be entered manually when needed. When the **DECIMAL** key is *up*, however, the decimal point may still be entered manually.

Storage Registers

There are 20 storage registers in the HP-81, numbered from 0 through 19. Registers 0 through 9 are accessed by pressing:

Registers 10 through 19 are accessed by pressing:

Register 0 is always reserved for your use (see page 13). Registers 1 through 9 are usually available for your use, while registers 10 through 19 are frequently required for one or more calculator routines (see the following table).

To list the contents of all storage registers, press **PRD** ***** .

PRD

The following table shows what the HP-81 stores in each register.

Register:	HP-81 Usage:
0	Constant storage (see page 11)
1	a) Length of time calculations – 1st time-period date
	b) Personal or corporate tax rate for After-tax Mode
2	a) Length of time calculations – 2nd time-period date
	b) Capital gains tax rate for After-tax Mode
3	
4	
5	
6	Cash-Flow Analysis
7	
8	
9	
10	a) Sum-of-the-squares for Summation
	b) Trend Line
11	a) Number of entries for Summation
	b) Trend Line
12	a) Sum of the numbers for Summation
	b) Trend Line
13	Trend Line
14	DAY
15	FV
16	i
17	PMT
18	PV
19	n

Only these
registers are
erased with

CLEAR.

The Operational Stack (a look inside the HP-81)

The operational stack in the HP-81 consists of four lines which are used for manipulating numbers. These lines are similar to writing long-hand arithmetic. For example:

$$\begin{array}{r} 312 \\ \times 14 \\ \hline 4368 \end{array}$$

That simple multiplication requires three lines on a piece of paper: two lines for the entries, and one for the answer.

To perform the same calculation with the HP-81, this is what happens (the four lines are labeled, from the bottom up, X, Y, Z, and T):

1. Enter: 312

T = (blank)

Z = (blank)

Y = (blank)

X = 312.

2. Press:

T = (blank)

Z = (blank)

Y = 312.

X = 312.

3. Enter: 14

T = (blank)

Z = (blank)

Y = 312.

X = 14.

4. Press:

T = (blank)

Z = (blank)

Y = (blank)

X = 4368.

For most simple calculations, only the **X**- and **Y**-lines are used. However, the four lines of the operational stack allow numbers to interact for mixed, chain, and serial calculations.

The **X**-line is always seen (displayed or printed). To see the contents of any other line, use **(R↓)** to 'roll down' the group of numbers one at a time. This action is like rolling a drum one-quarter revolution each time **(R↓)** is pressed. After pressing **(R↓)** four times, the numbers are back to their original position.

(x↔y) exchanges the numbers in the **X**-line and the **Y**-line.

(SAVE↑) pushes up the numbers in each line of the operational stack. That is, the number in the **X**-line is copied into the **Y**-line, the number in the **Y**-line is copied into the **Z**-line, the number in the **Z**-line is copied into the **T**-line, and the number in the **T**-line is lost.

To see how **SAVE↑** works, press: 1 **(SAVE↑)** 2 **(SAVE↑)** 3 **(SAVE↑)** 4

Now press **(R↓)** four times to see four lines of the operational stack:

(R↓)	4.00		(X)
		3.00	↓	(Y)
(R↓)	2.00	↓	(Z)
(R↓)	1.00	↓	(T)
(R↓)	4.00	↓	(X)

To see how **SAVE↑** copies the **X**-line into the **Y**-line and pushes up the numbers in the other lines, press **8**  .

Now press  four times to see the stack:

	8.00	↓	(Y)
	4.00	↓	(Z)
	3.00	↓	(T)
	8.00	↓	(X)

Certain routines in the HP-81 are performed on the line name shown on the key. For example,  raises the number in the **Y**-line to the power in the **X**-line, and  calculates the square root of the number in the **X**-line.

A good understanding of the operational stack will develop as you use the HP-81. This short explanation on how the stack works should help make it work for you.

Constant Storage and Arithmetic *p.13*
Percentage Calculations *p.14*
Percent Difference *p.15*
Total and Percentage *p.16*
Exponentiation *p.17*
Square Root *p.18*
Logarithms *p.18*
Calendar Functions *p.19*
Summation *p.21*

General Function Keys

The HP-81 general functions include special one-key functions and some specific operations which are necessary for understanding many routines described in the next chapters. A good knowledge of these functions allows greater flexibility and shortcutting when using your HP-81.

Constant Storage and Arithmetic

Register 0 is *always* reserved for storing a number (constant) for later use. Once stored, the constant (K) remains unchanged until either another number is stored or the HP-81 is switched OFF.

To **store a constant**, key in the number and press  .

To **use the constant** in a problem, press   instead of keying in the number.

To **multiply** by the stored constant, key in the number and press  .
xK

To **divide** by the stored constant, key in the number and press  .
÷K

Example: Multiply each of the following numbers by 3.1415.

28

85

76

32

19

Enter:

3.1415 **STO** **0**

28 **x** 85 **x**

76 **x** 32 **x**

19 **x**

3.1415	→0
28.00	N x
87.96	◇
85.00	N x
267.03	◇
76.00	N x
238.75	◇
32.00	N x
100.53	◇
19.00	N x
59.69	◇

Percentage Calculations

A. To take a **percentage** of a number:

- 1) Key in the base number, press **SAVE↑**
- 2) Key in the percentage (as a %), press **%** **◇**.

Example: Find 41% of 1598.

Enter:

1598 **SAVE↑** 41 **%** **◇**

1598.00	↑
41.00	%
655.18	◇

B. To add a **percentage** amount to a number:

- 1) Key in the base number, press **SAVE↑**
- 2) Key in the percentage, press **%** **+** **◇**.

Example: Find the selling price of a £1550 sailing boat when a 10.5% value add tax (VAT) is added on.

Enter:

1550 **SAVE↑** 10.5 **%** **+** **◇**

1550.00	↑
10.50	%
162.75	+
1712.75	◇

C. To **subtract a percentage** amount from a number:

1) Key in the base number, press **SAVE↑**

2) Key in the percentage (as a %), press **% - ◇** .

Example: Find the net cost of a \$5.95 item that includes a 25% retail profit mark-up.

Enter:

5.95 **SAVE↑** 25 **% - ◇**

5.95	↑
25.00	%
1.49	-
4.46	◇

Percent Difference

To find the **percentage difference** between two numbers:

1) Key in the first number, press **SAVE↑**

2) Key in the second number, press **Δ% ◇** .

Examples:

A. Find the percent decrease from 110 to 89.

Enter:

110 **SAVE↑** 89 **Δ% ◇**

110.00	↑
89.00	Δ %
19.09	

B. A company grosses \$1,234,567 in fiscal 1972 and \$1,765,432 in fiscal 1973. The manager would like to calculate the percentage increase in gross sales.

Enter:

1234567 **SAVE↑**
1765432 **Δ% ◇**

1234567.00	↑
1765432.00	Δ %
43.00	◇

Total and Percentage

Calculates the total of a series of numbers and finds the percentage that each entry is of the total. A maximum of 18 entries may be made since 'n' is stored in register 19.

General Routine:

1) Key in total number of entries, press **n**

2) Key in first entry, press **STO** **1**

3) Key in second entry, press **STO** **2**

(continue)

4) Key in tenth entry, press **STO** **.** **0**

5) Key in eleventh entry, press **STO** **.** **1**

(continue)

6) After the last entry is stored, press **EXT ()** **9** .

Example: An office supply store sold five different brands of pencils last year. The owner wishes to know the total number of pencils sold and the percentage of sales for each brand. Here are the figures:

Brand	Quantity Sold
A	1300
B	600
C	800
D	1700
X	2200

Enter:

5 **(n)**

1300 **(STO)** **(1)**

600 **(STO)** **(2)**

800 **(STO)** **(3)**

1700 **(STO)** **(4)**

2200 **(STO)** **(5)**

(EXT()) **(9)**

	5.00	→ N
	1300.00	→ 1
	600.00	→ 2
	800.00	→ 3
	1700.00	→ 4
	2200.00	→ 5
1	1300.00	
	19.70	%
2	600.00	
	9.09	%
3	800.00	
	12.12	%
4	1700.00	
	25.76	%
5	2200.00	
	33.33	%
Σ	6600.00	*
	100.00	%

Exponentiation

To raise a number to a positive power:

- 1) Key in the number and press **SAVE↑**
- 2) Key in the power and press **(y^x)**.

Examples:

A. Find 2^9 ($2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$)

Enter: 2 **(SAVE↑)** 9 **(y^x)**

2.00	↑
9.00	.1↑
512.00	◇

B. Now find $8^{2/3}$

Enter: 8 **(SAVE↑)** 2 **(SAVE↑)** 3 **(÷)**

(y^x)

8.00	↑
2.00	↑
3.00	↑
.67	◇
	M↑
4.00	◇

Now print the last result in scientific notation:

Press:   

3.999999999+000

This shows an example of 'calculating error', which occurs because logarithms are used when calculating Y^x and the results are not always accurate to the last decimal place. In this case the error magnitude is only .000000001 (1 billionth)!

Square Root

To find the square root of a number, enter the base number and press   .

Example: Find $\sqrt{213.16}$

Enter:

213.16  

213.16 $\sqrt{}$
14.60 \diamond

Logarithms

To calculate the common log (\log_{10}) of a number, enter the base number and press   .

To calculate the antilog₁₀, that is, to convert a logarithm to its original number:

- 1) Key in 10, press **SAVE**↑
- 2) Key in the logarithm, press  .

Logarithms are frequently used to measure natural phenomenon, such as light, heat, and sound. For instance, the Richter scale, used by seismologists to measure the magnitude of earthquakes, operates on a logarithmic basis, so there is a 10-fold increase from one unit to the next.

For example, the 1906 San Francisco earthquake, with a magnitude of 8.25 on the Richter scale, is estimated to be about 105 times greater than the Nicaragua quake of 1972. What would be the magnitude of the later on the Richter scale?

Enter:

8.25 

105    

8.25	↑
105.00	L
2.02	◇
6.23	◇

Calendar Functions

Enter dates for the following functions in a 'month-day-year' format (i.e., mm.ddyyyy). For example, May 7, 1965 would be entered as: 5.071965. The HP-81 calendar extends from January 1, 1901 (1.011901) through December 31, 2099 (12.312099). The calculator even automatically adds an extra day for each leap year, unless the 30-Day Month mode is set (see page 126).*

To calculate the number of days between two given dates:

- 1) Key in first date, press **SAVE↑**
- 2) Key in second date, press .

*The Actual-Day Month mode is automatically set when the HP-81 is switched ON.

Example; If today is September 22, 1973 and your anniversary is November 2, how many days do you have to buy a gift for your spouse?

Enter:

9.221973 

11.021973 

```

9.221973      ↑
11.021973
D A Y S
41.00
  
```

To calculate a date, including the day of the week:

- 1) Set the required days-per-month mode* (see page 126).
- 2) Key in starting date, press **SAVE**↑
- 3) Key in number of days between, press  .

DAT

If the date to be found is in the past, enter a negative number of days between.

The day of the week is indicated by a single digit (1 = Monday, 2 = Tuesday, etc.).

Example: If today is still September 22, 1973, what day was it when the stock market crashed on October 29, 1929?

Enter:

9.221973  10.291929 

  9.221973  

DAT

```

9.221973      ↑
10.291929
D A Y S
16034.00      S 2
                ↑
9.221973
- 16034.00      2
D A T E      2
10.291929
  
```

The HP-81 confirms that the stock market crashed on Black Tuesday.

*The Actual-Day Month mode is automatically set when the HP-81 is switched ON.

Summation

The summation keys allow you to calculate a running summation of a series of numbers.

General Routine:

- 1) Press **CLEAR**
- 2) Key in a number, press $\Sigma+$
- 3) Continue entering numbers with $\Sigma+$ for as much data as desired.

Each time a number is entered, the HP-81 automatically calculates the sum to that entry and the total number of entries. To find the number of entries at any time, press $\Sigma\div$; then press $\Sigma\div$ again to continue summing.

To print the current sum total without disturbing the routine, press $\Sigma\bar{\cdot}$.

The summation routine uses storage registers 10, 11, and 12, so don't store any numbers in them while using this routine. Also, don't press **CLEAR**, since it will erase the current sum-total.

To delete an entry and decrease the 'number of entries' counter by one, re-enter the wrong number and press $\Sigma-$.

Example: Find the total cost of these items after discounting them:

\$3.00 (15% discount)
\$6.50 (15% discount)
\$35.00 (25% discount)

Enter:

CLEAR 3 **SAVE** ↑ 15 **%** **-** **Σ+**

6.5 **SAVE** ↑ 15 **%** **-** **Σ+**

35 **SAVE** ↑ 25 **%** **-** **Σ+** **→** **Σ** Total cost

CLEAR	
3.00	↑
15.00	%
.45	-
2.55	Σ+
6.50	↑

Rebate and Payoff by Rule of 78's	<i>p.37</i>

Charging and receiving interest has long involved a series of tables and a lot of calculations. Since the HP-81 easily computes these numbers for you, the drudgery is gone and a thinking man can take a more proper role.

In performing these calculations, the *interest rate* (i) must be entered as the rate per payment period. The *number of time or payment periods* (n) refers to the number of payments to be made, assuming that the interest charge will be computed at the end of each payment period. The *present value* (PV) refers to the original amount of principal, not including any interest charges. The *future value* (FV) refers to the amount of principal plus interest.

For all these calculations, any length payment period is acceptable, however, the terms 'month' and 'year' are generally used in the following explanations, since they are the most reasonable and likely time periods.

While the explanation for each routine should be clear, all of the terms used may not be. This short glossary may be of help.

Accrued Interest is the amount earned through interest but not collected. That is, neither added to the principal nor yet paid out.

Add-on Interest Rate is used to compute the interest charges which are 'added-on' to the principal amount when a loan is financed.

Balloon Payment is a large payment generally used to pay off a loan. In the HP-81 it must be the final payment, and the balloon payment amount entered must not include the regular monthly payment due at that time.

Compounding Interest is the action of adding the interest amount earned to the principal, thus increasing the amount of principal which will earn interest (e.g., a savings account).

Nominal Interest Rate is the stated interest rate. It assumes that only the principal will remain to draw interest — and allows no compounding or other factors which would affect the actual interest rate.

Effective Interest Rate or Annual Percentage Rate (APR) is the actual interest rate. It takes into account such factors as compounding of interest, odd-days charges, early payoff, a balloon payment, etc. This rate reflects the total cost of borrowing.

Odd Days is the number of days beyond 30 between the time a loan agreement is signed and the first payment is made. Interest is charged for each odd day.

Payment Amount includes part of the total principal and part of the total interest charge.

Pay Off is the total amount (principal plus interest) required to complete payment of a loan before it is due. It takes into account a rebate on interest charges.

Principal is the basic amount on which interest is charged or paid.

Rebate is a refund, generally of interest charges, due when a loan is paid off early.

Rule of 78's is a method of computing rebate of interest charges on loans where the sum of the numbers, representing the months of the year ($1+2+3+\dots+12 = 78$), is used to compute the rebate to any month in the year. By this method, the rebate in July for a 1-year loan made in January would be computed by:

- a) $1+2+3+4+5+6+7 = 28$
- b) $78 - 28 = 50$
- c) $50 - 78 = 64.1\%$ (Percent amount of interest paid)
- d) $28 - 78 = 35.9\%$ (Percent of interest charge rebate)

Compound Interest Calculations

This routine includes four variations of the \boxed{n} , \boxed{i} , \boxed{PV} , and \boxed{FV} keys to solve for:

- the number of time periods,
- the interest rate per time period,
- the present value, or
- the future value.

Any three values may be used to calculate the fourth. The three entries may be made in any order, and any or all of the entries may be updated and the problem re-solved without re-entering those values which do not change.

If you wish to use some of the entered values in a new problem (one that solves for a different unknown, simply $\boxed{\text{CLEAR}}$ the old problem, then recall and reinitialize the carry-over values with $\boxed{\text{RCL}}$ $\boxed{\text{Entry Keys}}$.

Note that the interest (i) must be expressed as a rate per time period (n).

To solve for n:

- 1) Key in interest rate per time period, press \boxed{i}
- 2) Key in present value, press \boxed{PV}
- 3) Key in future value, press \boxed{FV}
- 4) To find the number of time periods, press \boxed{n} .

To solve for i:

- 1) Key in number of time periods, press \boxed{n}
- 2) Key in present value, press \boxed{PV}
- 3) Key in future value, press \boxed{FV}
- 4) To find the interest rate per time period, press \boxed{i} .

To solve for PV:

- 1) Key in number of time periods, press **n**
- 2) Key in interest rate per time period (as a %), press **i**
- 3) Key in future value amount, press **FV**
- 4) To calculate the present value, press **PV**.

To solve for FV:

- 1) Key in number of time periods, press **n**
- 2) Key in interest rate per time period (as a %), press **i**
- 3) Key in present value amount, press **PV**
- 4) To calculate the future value, press **FV**.

Examples:

A) If \$500 is invested for 2 years at 5 $\frac{3}{4}$ % annual interest, what is the future value when interest is compounded annually? Semi-annually? Monthly?

Enter:

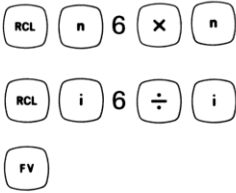

CLEAR 2 **n**
 5.75 **i**
 500 **PV** **FV**

Enter:

To find the time in years,

Enter:

134.50	↑
12.00	+
11.21	◇

Accrued Interest

Calculates the interest earned, but not collected, for a given loan amount when the interest rate and either the number of elapsed days or the dates of the first and last days of the time period for accrual is known. The calculation is made for both a 365-Day Year and 360-Day Year bases. The mode setting determines which Day/Year basis answer is shown first.

General Routine:

- 1) Set the required days-per-year calculating mode* (see page 125).
- 2) *Either* key in the number of elapsed days and press **n** *or* key in the first date and press **SAVE↑** and then key in the last date and press **DAY** **n**
- 3) Key in the annual interest rate, press **i**
- 4) Key in the payment amount, press **PV**
- 5) Press **■** **PMT** to calculate the accrued interest. To see the interest calculated using the alternate days-per-year mode, press **R↓**.

Example: How much interest will accrue on \$2,600 between January 14, 1974 and February 11, 1974, at a 10½% annual interest rate for a 365-day year? A 360-day year?

Enter:

(in 365 day/year mode)

CLEAR **■** **EXT(i)** **5** (365-Day Year Mode)

1.141974 **SAVE↑** 2.111974 **DAY** **n**

10.5 **i** 2600 **PV**

■ **PMT** **R↓**

365-day year basis →

	21.23		↓

*The 365-Day Year mode is automatically set when the HP-81 is switched ON.

Accumulated Interest Paid Between Periods *

Calculates the amount of interest which is accumulated between two given payments, and the principal remaining after the latter payment. The rounding format affects this calculation.

General Routine:

- 1) Key in the beginning payment number, press **STO** **1**
- 2) Key in the last payment number, press **STO** **2**
- 3) Key in the interest rate per time period, press **i**
- 4) Key in the payment amount per period, press **PMT**
- 5) Key in the present value (principal), press **PV**
- 6) Press **Σ+** to calculate the remaining principal and interest accumulated.

Example: What is the accumulated interest and remaining principal from the 30th to the 35th payment of a 30-year mortgage (360 payments) with a principal amount of \$25,000, an annual interest rate of $7\frac{1}{2}\%$, and payments of \$169.90?

Enter:

CLEAR **30** **STO** **1**

35 **STO** **2** **7.5** **S

The remaining principal is \$24,467.80 and the accumulated interest is \$919.73.

*Also see 'Amortized Loan Schedule', page 46.

Effective Interest Rate

Calculates the interest rate per payment given the loan amount, the payment amount, and the number of payments.

General Routine:

- 1) Key in total number of payments, press **n**
- 2) Key in the payment amount, press **PMT**
- 3) Key in the principal amount, press **PV**
- 4) Press **i** to calculate the interest rate per payment.
- 5) To find the annual interest rate, key in number of payments per year and press **x**.

Example: What is the effective rate of interest per payment on a 36-month loan for \$2,655.00 at a monthly payment of \$82.22?

Enter:

CLEAR 36 **n**

82.22 **PMT**

2655 **PV** **i**

CLEAR		
36.00	→	N
82.22	→	PT
2655.00	→	P
I N T		
.60		

The interest rate per payment is .6%.

Effective Annual Rate to Nominal Rate

Calculates the interest rate which, when compounded periodically, is equivalent to the stated annual rate. This routine illustrates that the effective periodic rate is not just the annual rate divided by the number of compounding periods per year.

To find the interest rate per period, given the effective annual rate:

- 1) Key in number of payments per year, press **n**
- 2) Key in the annual interest rate, press **i** ;
then press **EXT()** **0** .

Example: What is the interest rate per period on a savings account which pays 6.55% annual interest compounded monthly?

Enter:

CLEAR 12 **n**
6.55 **i** **EXT()** **0**

CLEAR
12.00 → N
6.55 → I
I N T
.53

The monthly interest rate is .53%

'Add-on' Rate Converted to Annual Rate

Calculates the annual interest rate from a stated 'add-on' rate. The monthly payment can also be calculated with this routine, if the loan amount is entered.

General Routine:

- 1) Key in the number of months for loan, press **n**
- 2) Key in the 'add-on' rate (per annum), press **i**
- 3) Press **i** again to calculate the annual rate.

Now you can find the monthly payment:

- 4) Press **xzy**
- 5) Key in the principal amount, press **x** .

Example: What is the annual interest rate (to three decimal places) for a 36-month loan at 8% Add-on?

Enter:

CLEAR 3
 36 n
 8 i i

CLEAR		
36.000	→	N
8.000	→	I
I N T		AN %
14.548		

The annual interest rate is 14.548%.

Add-on (with odd days) to Annual Rate

Calculates the effective annual interest rate given the number of odd days, the add-on interest rate, and the number of payments to be made.

General Routine:

- 1) *Either* key in number of odd days and press STO DAY *or* key in date of first date and press **SAVE↑** and key in date of last odd day and press DAY
- 2) Key in number of payments, press n
- 3) Key in add-on rate, press i
- 4) To calculate the effective annual interest rate, press EXT() 7.

Example: What is the effective annual interest rate (to four decimal places) of a 24-month loan at 7½% add-on with 45 days until the first payment?

Enter:

CLEAR 4

45 SAVE↑ 30 - STO DAY

24 n 7.5 i EXT() 7

	→ 4 *	
24.0000	→ N	
7.5000	→ I	
I N T	AN %	
13.5076		

The annual interest rate is 13.5076%.

Interest Rate for Loan with Balloon Payment

Calculates the periodic interest rate of a loan with a final balloon payment. The balloon payment is entered as an addition to the regular monthly payment. The monthly amount should not be included in the balloon payment amount. This routine uses the Bond Yield-to-Call routine.

General Routine:

- 1) Set Bond Mode* by pressing EXT() 8
- 2) Set Annual Coupon Mode by pressing EXT() 2
- 3) Key in balloon payment amount, press FV
- 4) Key in number of payments, press **SAVE↑** 365 × STO DAY
- 5) Key in monthly amount, press PMT
- 6) Key in principal amount, press PV
- 7) To calculate the interest rate per payment period, press i YTM.

Now you can find the annual interest rate:

- 8) Key in the number of payments per year, press ×.

*The Bond mode is automatically set when the HP-81 is switched ON.

Example: What is the monthly and annual percentage rate for a \$4,000 loan with 36 payments of \$95 each, including a final payment of \$1,672.59?

Enter: CLEAR EXT () 2 (Annual Coupon Mode)

1672.59 S

YIELD
TO CALL
.96

The monthly interest rate is .96%.

Press: 12 x

12.00 x
11.50 ◇

The annual interest rate is 11.56%.

Rebate by Rule of 78's

Calculates the rebate and amount of interest paid during the final payment for a loan paid off before it is due. Since this routine uses the Sum-of-the-Digits (SOD) depreciation method, the printout should be interpreted as: DEPR = Interest paid with final payment; PV = Rebate. Also, the current rounding format affects this routine.

General Routine:

- 1) Key in payment number at pay-off, press STO 1
- 2) Key in total number of payments, press STO 2
- 3) Key in total interest payable, press PV
- 4) Press SOD CAL.

Example: What is the interest amount included with the final payment and the interest charge rebate on a 24-month loan paid off after 14 months, when the total finance charge is \$258.32?

Enter:

CLEAR 14 **STO** 1

24 **STO** 2

258.32 **PV** **SOD**
CAL

```

CLEAR
14.00  →I

P  V
47.37
    
```

The interest paid with the final payment is \$9.47, and the interest-charge rebate is \$47.37.

Rebate and Payoff by Rule of 78's

Calculates the pay-off and interest rebate for a loan which is prepaid. The current rounding format affects this routine.

General Routine:

- 1) Key in the payment number at payoff, press **STO** 1
- 2) Key in the total number of payments, press **STO** 2
- 3) Key in the payment amount, press **PMT**
- 4) Key in the total interest payable, press **PV**
- 5) Key in the principal amount, press **FV**
- 6) Press **EXT()** 5 to calculate the interest rebate, the interest paid, and the total amount of payoff.

Example: What is the interest-charge rebate, the amount of interest paid, and the total pay-off after 17 months of a 36-month loan with a principal of \$3,200, payments of 104.76 and a total finance charge of \$571.36?

Enter:

CLEAR 17 **STO** 1

36 **STO** 2 104.76 **PMT**

571.36 **PV** 3200 **FV**

Glossary *p.41*

Present Value of an Annuity *p.41*

Future Value of an Annuity *p.42*

Payment Amount for an Annuity *p.43*

Payments Required for a Sinking Fund *p.44*

Number of Payments Required for a Loan *p.45*

Required Interest Rate for a Stated Future Value *p.46*

Amortized Loan Schedule *p.46*

An *annuity* is a series of equal payments made at equal intervals of time. The HP-81 assumes an *ordinary annuity*, where payments are made at the end of each payment period.

A *sinking fund* is a type of annuity created to pay off a debt which will come due at a certain date in the future. By this method, periodic payments are made into the fund at the payment level and interest rate necessary to reach the required sum by the future date.

The annuity routines use a combination of \boxed{n} , \boxed{i} , \boxed{PMT} , \boxed{PV} , and \boxed{FV} entries. Data may be entered in any order. Any of the entered values may be changed and the answer recalculated without re-entering the rest of the values.

Present Value of an Annuity

Calculates the present value of a series of equal payments compounded at a given interest rate over a set period of time.

To find the principal value of a loan:

- 1) Key in total number of payments, press \boxed{n}
- 2) Key in interest rate per payment period, press \boxed{i}
- 3) Key in the payment amount, press \boxed{PMT}
- 4) Press \boxed{PV} .

Example: What is the maximum price that you could finance for a new house, if you were able to make \$200 monthly payments (principal and interest) on a 30 year loan with an 8% annual interest rate?

Enter:

CLEAR 360 **n**

 .67 ♦
 → I
 200.00 → PT
 P V
 27256.70

You could afford a principal of \$27,256.70.

Future Value of an Annuity

Calculates the future value of a series of equal payments when compounded at a given interest rate for a set period of time.

To find the amount of a sinking fund:

- 1) Key in the total number of payments, press **n**
- 2) Key in the interest rate per payment, press **i**
- 3) Key in the payment amount, press **PMT**
- 4) Press **FV**.

Example: How much money would you have after depositing \$100 per month for 5 years into a savings account that paid 5½% compounded monthly?

Enter:

CLEAR
 12 **SAVE** ↑ 5 **×** **n**
 5.5 **SAVE** ↑ 12 **÷** **i**

 F V
 6888.08

After 5 years you'd have \$6,888.08.

Payment Amount for an Annuity

Calculates the payment amount necessary to pay off a given sum being compounded at a given interest rate over a set period of time.

To find the payment amount for a sinking fund:

- 1) Key in total number of payments, press **n**
- 2) Key in interest rate per payment period, press **i**
- 3) Key in principal amount, press **PV**
- 4) Press **PMT**.

Example: What would your monthly payment be on a \$3,600 loan with a 14% annual interest rate, if you must pay off the loan in 36 months?

Enter:

CLEAR 36 **n**
 14 **SAVE** 12 **÷** **i**
 3600 **PV** **PMT**

CLEAR		
36.00	→	N

N	
120.02	

You'll have to make 120 payments.

Required Interest Rate for a Sinking Fund

Calculates the interest rate per payment period necessary to give a set future amount when the present amount, the payment amount, and the time period are known.

General Routine:

- 1) Key in total number of payments, press **n**
- 2) Key in the payment amount, press **PMT**
- 3) Key in the future value, press **FV**
- 4) Press **i** to calculate the necessary interest rate per payment period.

Example: If you are able to invest \$100 per month in order to have \$5,000 after 42 months, what yield must you obtain on your investment?

Enter:

CLEAR 42 **n**
100 **PMT** 5000 **FV**
i

CLEAR		
42.00	→	N
100.00	→	PT
5000.00	→	F
T		
.83		

Your investment goal requires a .83% monthly yield.

Amortized Loan Schedule

Calculates the interest paid, the principal paid, and the remaining balance for all payment periods specified. The loan amount, interest rate, and payment amount must be entered. The rounding format set affects this routine.

General Routine:

- 1) Key in the first payment number in question, press **STO** **1**
- 2) Key in the last payment number in question, press **STO** **2**
- 3) Key in the principal amount, press **PV**
- 4) Key in the interest per payment period, press **i**
- 5) Key in the payment amount, press **PMT**
- 6) Press **EXT()** **6** to calculate and print the schedule. The interest paid for the scheduled periods is printed after the schedule.

Example: List the amortization schedule from the 13th through the 15th payment of an 8¼% mortgage for \$42,000 with monthly payments of \$345.30.

Enter:

CLEAR 13 **STO** **1**

Glossary *p.51*

Straight-Line Depreciation *p.52*

Depreciation by Sum-of-the-Digits Method *p.54*

Depreciation Schedule by Sum-of-the-Years'-Digits Method *p.55*

Depreciation Schedule by Declining-Balance Method *p.56*

Depreciation to a Stated Salvage Value *p.57*

Depreciation represents the loss in value of a physical asset through use and age over a time period.

Glossary

Depreciable life of a physical asset is the number of years (usually) from the time it is purchased until it is depreciated to its salvage value.

Salvage Value represents the amount at which the asset could be sold after its depreciable life has expired.

Depreciation Amount is the monetary amount which the asset will lose in value for any given year. This may be the same for each year in the life of the asset (as in *straight-line depreciation*).

Remaining book value of the asset is the real worth of the asset for any year after all depreciation to that point has been subtracted.

Here are the methods for computing depreciation which you can perform using the HP-81:

Straight-Line Depreciation where the asset declines in value by a set amount each year of its depreciable life.

Sum-of-the-Digits Method (Sum-of-the-Years-Digits Method and Rule of 78's) This is a general term for methods of computing depreciation where the sum of the numbers, which represent the number of months or years left in the life of the asset, is used to compute the depreciation amount to any particular month or year. The *Rule of 78's* refers to the sum of the numbers representing the months of the year ($12 + 11 + 10 + \dots + 2 + 1 = 78$). By this method, depreciation in July of an asset purchased in January, with a depreciable life of one year would be computed by:

- 1) $12 + 11 + 10 + 9 + 8 + 7 + 6 = 63$
- 2) $63 \div 78 = 81\%$ of the depreciable value is spent
- 3) $100\% - 81\% = 19\%$ of the depreciable value is left.

The *Sum-of-the-Years-Digits Method* refers to the sum of the numbers representing the number of years left in an asset's depreciable life. For example, with a 10-year asset life, the base digit is $10 + 9 + 8 + 7 + \dots + 1 = 55$; depreciation after the 4th year would be computed by:

- 1) $10 + 9 + 8 + 7 = 34$
- 2) $34 \div 55 = 62\%$ of the total depreciation is spent
- 3) $100\% - 62\% = 38\%$ of the depreciable value is left.

Declining-Balance Method uses a constant percentage (called the diminishing factor) which, when applied to the remaining book value, gives the depreciation amount for that year. This depreciation amount declines each year, since the book value to which the percentage applies also declines.

Depreciation to Salvage Value is used to compute depreciation down to an anticipated salvage value. In other methods of calculating depreciation, the final depreciable value is considered to be zero, since either the salvage amount is subtracted from the initial asset value before any depreciation is computed, or a negligible salvage value is assumed.

NOTE

The current rounding format affects the Depreciation Routines.

Straight-Line Depreciation

Calculates the constant depreciation amount and the remaining depreciable value per year for an asset, given the depreciable asset value and the number of years of depreciation.

General Routine:

- 1) Key in the depreciable amount (purchase less salvage value), press **SAVE↑,SAVE↑**
- 2) Key in the asset life in years, press $\boxed{\div}$
- 3) To find the first year's remaining value, press $\boxed{\text{STO}} \boxed{1} \boxed{-} \boxed{\diamond}$
- 4) Press $\boxed{\text{RCL}} \boxed{1} \boxed{-} \boxed{\diamond}$ for each year's remaining value.

Example: A parking lot is installed at a cost of \$29,750.00. If the useful life of the paving is 20 years, what is the annual depreciation amount and remaining value for the first three years by the straight-line depreciation method?

Enter:

29750 $\boxed{\text{SAVE}\uparrow} \boxed{\text{SAVE}\uparrow} 20 \boxed{\div}$

$\boxed{\text{STO}} \boxed{1} \boxed{-} \boxed{\diamond}$

$\boxed{\text{RCL}} \boxed{1} \boxed{-} \boxed{\diamond}$

$\boxed{\text{RCL}} \boxed{1} \boxed{-} \boxed{\diamond}$

29750.00	↑
	↑
20.00	↑
1487.50	◇
	→1
	-
28262.50	◇
	↑
1487.50	→1
	-
26775.00	◇
	↑
1487.50	→1
	-
25287.50	◇

The depreciation amount is \$1,487.50 and the remaining values for the three years are:

Year 1 = \$28262.50

Year 2 = \$26775.00

Year 3 = \$25287.50

Depreciation by Sum-of-the-Digits Method

Calculates the depreciation amount and the remaining book value of an asset, one year at a time. Only the depreciable value of the asset, its expected life, and the beginning year of depreciation need be entered. The depreciable value must be entered as the original cost minus the eventual salvage value.

General Routine:

- 1) Key in first year number of depreciation in question, press **STO** **1**
- 2) Key in expected life (in years) of asset, press **STO** **2**
- 3) Key in asset cost, press **SAVE**↑
- 4) Key in salvage value, press **—** **PV**
- 5) To find the beginning year's depreciation and remaining depreciable value, press **—** **SOD**
- 6) Repeat pressing **SOD** to see each successive year's depreciable amount and remaining depreciable value.

Now, to find the depreciation and remaining value for any particular year:

- 7) Key in the year number, press **STO** **1** and press **—** **SOD**
- 8) Repeat step 7 as needed.

Example: A tug boat was purchased for \$132,000.00 thirteen years ago. After an expected life of 25 years, it will be sold for approximately \$5,000. What is the boat's depreciation amount and remaining depreciable value for this year?

Enter:

13 **STO** **1** 25 **STO** **2**
 132000 **SAVE** 5000 **-** **PV**
SOD
 CAL

```

      13.00  →1
      25.00  →2
    132000.00  ↑
      5000.00  -
                      →P
                DEPR
      5080.00
P   V
30480.00
  
```

The depreciation amount is \$5080.00, and the remaining value is \$30,480.00.

Schedule by Sum-of-the-Years'-Digits Method

This routine calculates a schedule which includes the depreciation amount and remaining book value of an asset over a given number of years. Only the value of the asset, its expected life, and the beginning year of the schedule must be entered. The depreciable amount must be entered as the initial value of the asset *minus* the eventual salvage value.

General Routine:

- 1) Key in the first-year number of the schedule, press **STO** **1**
- 2) Key in life (in years) of asset, press **STO** **2**
- 3) Key in cost of asset, press **SAVE**↑
- 4) Key in salvage value, press **-** **PV**
- 5) Press **EXT()** **4** to calculate and print the schedule.

Example: A company will purchase office equipment costing \$4,857.00. The trade-in value after 4 years should be \$1800. What will be the depreciation amount and remaining value for each year?

Enter:

1 **STO** 1 4 **STO** 2
 4857 **SAVE** 1800 **-** **PV**

Schedule by Declining-Balance Method

Calculates a depreciation schedule of the depreciation amount and the remaining book value of an asset over a given number of years. For this method of calculating depreciation, a negligible salvage value is assumed.

General Routine:

- 1) Key in first-year number of schedule, press **STO** 1
- 2) Key in life (in years) of asset, press **STO** 2
- 3) Key in initial cost of asset, press **PV**
- 4) Key in 'diminishing factor', press **i**
- 5) Press **EXT()** 2 to calculate and print the depreciation schedule.

Example: A piece of construction equipment is purchase for \$25000.00. It has a useful life of 10 years and will have a negligible salvage value at that time. Calculate a depreciation schedule for the last six years, assuming a 200% depreciation rate (double declining-balance method).

Enter:

5 **STO** 1 10 **STO** 2

25000 **PV** 2 **i**

Depreciation to a Stated Salvage Value

This routine calculates a 'diminishing factor' and prints the depreciation schedule. The schedule includes the year number, the depreciation amount and the remaining book value of the asset. The salvage amount which is entered must be a reasonable amount in relation to the original cost and expected life of the asset, so that the diminishing factor and depreciation schedule will also be reasonable and useful.

To find the 'diminishing factor' and print the Declining-Balance Depreciation Schedule:

- 1) Key in the first-year number of the schedule, press **STO** 1
- 2) Key in the life (in years) of the asset, press **STO** 2
- 3) Key in the initial asset value, press **PV**
- 4) Key in the salvage value, press **FV**
- 5) Press **EXT()** 3.

Example: A professional gardener bought five lawnmowers for a total of \$489.75. After seven years the machines will be sold for scrap for \$50. What is the diminishing factor (depreciation rate) and annual depreciation amount?

Enter:

1 STO 1 7 STO 2
 489.75 PV 50 FV

Glossary *p.61*

Discounted Cash Flow *p.61*

Rate of Return for Uneven Cash Flow *p.63*

Rate of Return for Even Cash Flow *p.64*

The cash-flow analyses available with the HP-81 are highly-flexible methods of determining the value of an investment, based on an anticipated or actual return of cash.

The cash-flow routines are useful for determining, for example, the interest rate that could be paid on a loan to purchase new machinery — based on the profits which should be returned from the use of that machinery. They are also good investment guides for comparing two or more possible investments to see which is best, based on the probable return from each investment.

Glossary

The *internal rate of return* of a cash flow refers to the average yield per year (per cash-flow period) over the total investment period. This rate of return is based on the amount invested and amount returned.

The *discounted cash flow* approach allows the user to specify the anticipated yield of the cash flow and find out quickly if that rate of return will be achieved. The result is the dollar amount which will be realized *beyond* the anticipated yield (the net gain or loss). This method may be used as a quick trial-and-error way of determining the actual yield of a cash flow, or to compare cash flow yield to the cost (interest rate) of borrowed capital.

Discounted Cash Flow

Calculates the net gain or loss *beyond an expected yield* for a cash-flow investment. If the result is zero, the cash-flow yield is exactly as expected. The entries must be made in the order shown, and the cash-flow amounts should be entered slowly, since the HP-81 calculates and prints the net gain or loss after each cash-flow entry. The original investment must be entered as a negative number since it represents a cash outlay.

To find the net gain or loss *beyond an expected yield* for a cash-flow investment:

- 1) Press **CLEAR**
- 2) Key in expected yield (in %) per period, press **i**
- 3) Key in amount of original investment, press **CHS** **PV**
- 4) Key in first cash-flow amount, press **Σ+**
- 5) Repeat step 4 for each successive cash flow. The last number printed is the final net gain or loss.

Example: An investor bought a share of the Sitzmark Ski Company for \$10,000.00. He borrowed money for the investment at 11% annual interest and expected to get his money back in 5 years. Based on the following cash flows, was it a profitable investment?

Year 1: \$3800.00

Year 2: \$4125.00

Year 3: \$4350.00

Year 4: \$3654.00

Year 5: \$2775.00

Enter:

CLEAR 11 **i** 10000 **CHS** **PV**

3800 **Σ+** 4125 **Σ+**

4350 **Σ+** 3654 **Σ+**

2775 **Σ+**

CLEAR		
	11.00	→ I
-	10000.00	→ P
	3800.00	Σ+
-	6576.58	◇
	4125.00	Σ+
-	3228.63	◇
	4350.00	Σ+
-	47.95	◇
	3654.00	Σ+
	2359.05	◇
	2775.00	Σ+
	4005.88	◇

Yes, the investment was profitable, since he made his 11% and \$4005.88 more.

Rate of Return For Uneven Cash Flow

This routine calculates the internal rate of return (yield) of a series of periodic cash flows from an initial investment. A maximum of nine cash-flow entries may be made.

If both cash inflows and outlays have occurred during a time period, they should be expressed together as a *net* cash flow for that period (outlays must be entered as negative numbers). Cash outlays must be entered at the beginning of the cash-flow listing (i.e., cash outflows must not be intermixed with cash inflows). The rate of return is expressed as a percent per cash-flow time-period.

To find the internal rate of return (yield, in %) of a series of cash flows:

- 1) Key in the initial investment, press **CHS** **PV**
- 2) Key in total number of cash flows, press **n**
- 3) Key in first cash-flow amount, press **STO** **1**
- 4) Key in second cash-flow amount, press **STO** **2**
- 5) Continue storing each successive cash flow in its corresponding storage register. The ninth (last) cash flow will be stored in register 9.
- 6) Press **EXT()** **1** to find the rate of return (the calculation may take up to two minutes).

Example: A recent blackmailer spent \$12,500.00 in suitcases, phone-calls, a car, and lawyer's fees. Based on the following flow of pay-offs, was his investment profitable?

Year 1: \$1200

Year 2: \$1800

Year 3: \$5000

Year 4: \$1100

Year 5: \$ 900

Year 6: \$ 750

Enter:

12500 (CHS) (PV) 6 (n)

1200 (STO) (1) 1800 (STO) (2)

5000 (STO) (3) 1100 (STO) (4)

900 (STO) (5) 750 (STO) (6)

(EXT()) (1)

-	12500.00	→P
	6.00	→N
	1200.00	→1
	1800.00	→2
	5000.00	→3
	1100.00	→4
	900.00	→5
	750.00	→6
	DISC	ROR
-	4.71	

The rate of return was -4.71%. No, crime still does not pay.

Rate of Return For Even Cash Flows

Calculates the rate of return (yield) of a series of equal periodic cash flows. Any number of cash flows may be used. The entry sequence for this routine differs from that of the Uneven Cash-Flow Analysis routine previously explained, because a different approach is used.

General Routine:

- 1) Press (CLEAR)
- 2) Key in the total number of cash flows, press (n)
- 3) Key in the amount of initial investment, press (PV)
- 4) Key in the cash-flow amount, press (PMT)
- 5) Press (i) to find the rate of return.

Example: A woman wishes to buy a boarding house but she must get a mortgage at 11.5% interest. If she could collect \$3,600 a year in rent and could have a 15-year mortgage on the \$32,500 house, would the venture be profitable?

Enter: CLEAR

15 n 32500 PV

3600 PMT i

```

          CLEAR
          15.00    → N
          32500.00 → P
          3600.00  → PT
I  N  T
          7.14

```

At a 7.14% rate, the return is not equal to the mortgage interest rate.

If she raises the rent to \$4,800 a year, would the investment be profitable?

Enter:

4800 PMT i

```

          4800.00    → PT
I  N  T
          12.11

```

At a 12.11% rate of return, the investment would be profitable, since that rate is greater than the mortgage interest rate.

Glossary *p.69*

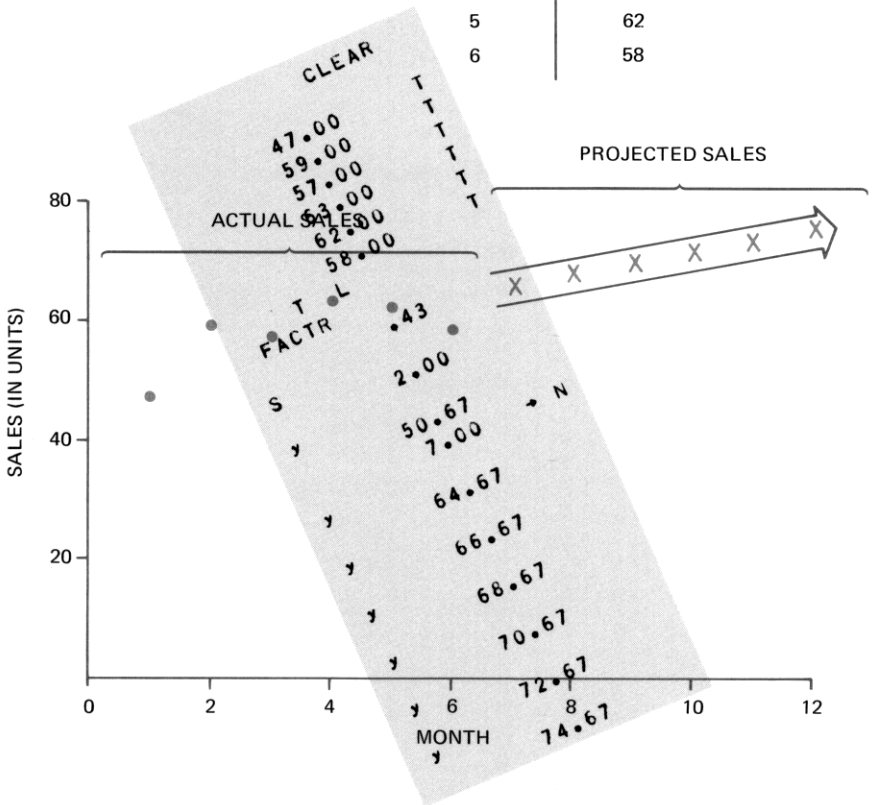

Mean and Standard Deviation *p.70*

Trend Line *p.71*

Expanded Trend Line *p.74*

Log Trend Line *p.76*

Month	No. of Units Sold
1	47
2	59
3	57
4	63
5	62
6	58

This section includes four statistics routines useful in business.

Glossary *

The *mean* of a set of numbers is the arithmetic average found by adding all the entries and dividing the sum by the number of entries.

The *standard deviation* of a set of a numbers expresses the average difference between the data values and the mean of those values.

A *trend line* is a method of analyzing a series of data values for a trend pattern. It is particularly useful for predicting future values, assuming that the trend will continue.

Least-squares linear regression is the statistical name for the method which the HP-81 uses to find the best possible trend line through the various data values.

The *determination coefficient* tells how well the trend line fits the data values, where a factor of '1' indicates a perfect fit and a factor of '0' indicates no fit at all (i.e., random values). Since the trend line is a straight line, it may not always be the best method for prediction when the entry values go up and down periodically; however the determination coefficient will tell the user how useful the trend line is for any particular set of data values.

The *log trend line* is useful when percent changes rather than value changes are important, as for growth analysis. The steeper the slope of the trend line, the greater the growth.

The *slope* and *Y-axis intercept* of the trend line are essential for calculating the actual equation of that line. The equation is:

$$Y = \text{'Y-axis intercept'} + \text{'slope'} * X$$

*See Appendix D for all statistics equations.

That equation may be used to make a chart of the trend line. Note that semi-log graph paper must be used to plot the Log Trend Line.

Mean and Standard Deviation

To calculate the arithmetic mean and standard deviation* from that mean of a group of numerical entries:

- 1) Press **CLEAR**
- 2) Key in first number, press **Σ+**
- 3) Repeat step 2 for each number entry;
- 4) Press **\bar{x}** .

NOTE

To correct a wrong entry, key in the number again and press **Σ+**.

Example: In a recent survey to determine the average age of the 10 wealthiest people in the U.S., the following data was obtained:

62 84 47 58 68 60 62 59 71 73

Of the ages given, what is the mean and the standard deviation?

Enter: **CLEAR**

62 **Σ+** 84 **Σ+** 47 **Σ+**
 58 **Σ+** 68 **Σ+** 60 **Σ+**
 62 **Σ+** 59 **Σ+** 71 **Σ+**
 73 **Σ+** **\bar{x}**

*The formula used for standard deviation is: $\frac{\sum x^2 - 1/n (\sum x)^2}{n-1}$

	CLEAR	
	62.00	Σ+
	84.00	Σ+
	47.00	Σ+
	58.00	Σ+
	68.00	Σ+
	60.00	Σ+
	62.00	Σ+
	59.00	Σ+
	71.00	Σ+
	73.00	Σ+
σ	10.10	
N	10.00	
\bar{x}	64.40	

Now, delete the highest and lowest ages and find the new mean and standard deviation:

Enter:

84   47   

	84.00	Σ-
	47.00	Σ-
σ	8.00	◇
N	5.74	◇
\bar{x}	64.13	◇

Trend Line Analysis

This routine calculates the linear regression of a series of equally spaced data points. The HP-81 calculates the determination coefficient which expresses the 'goodness of fit' of the trend line through the data points. A coefficient of 1 (or -1) means a perfect fit while a factor of 0 shows a completely random pattern, which reflects up on the reliability of the trend line. The slope of the trend line and its Y-axis intercept are also calculated.

General Routine:

- 1) Press 
- 2) Key in the first data value, press 
- 3) Repeat step 2 for each data value to be entered;
- 4) Press   to find the coefficient, slope, and Y-axis intercept point.

To find an unknown point on the trend line:

- 5) Key in the appropriate time-period number (X-value), press 
- 6) Press  to print the predicted Y-value.

Example: The Hunt-n-Peck Typewriter Co. wishes to quickly analyze the sales rate of their newest product, so that its future sales rate can be predicted. Here are the sales results for the product's first six-month period:

Month	No. of Units Sold
1	47
2	59
3	57
4	63
5	62
6	58

To find the sales trend for the first six-month period:

Enter: CLEAR

47 TL 59 TL 57 TL

63 TL 62 TL 58

TL
CAL

Determ. coeff. →

slope →

intercept →

Based on the previous six-month interval, find the product sales for each of the next six months:

Enter:

7 n TL

Repeat pressing TL for each successive month (the HP-81 automatically increments n).

CLEAR		
	47.00	T

V
E

74.67

%

Δ %

% growth for year

47.00

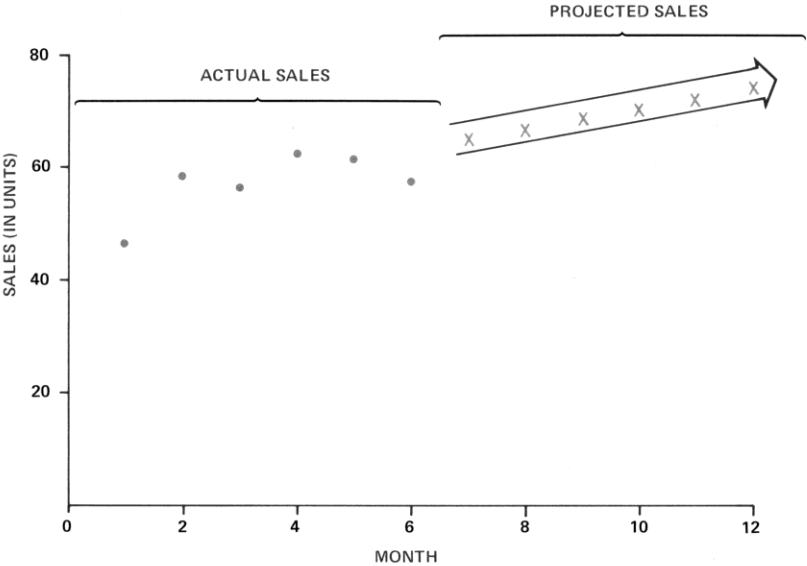

↑

74.67

Δ %

58.87

◇

Expanded Trend Line

Calculates a two-variable trend line (by the least-squares linear regression method), including the determination coefficient, slope, and Y-axis intercept. The equation of the trend line is:

$$Y = \text{'Y-axis intercept'} + \text{'Slope'} * X$$

This routine allows the user to enter both X and Y values, as is necessary when the data points are not equally spaced. The X value is the independent variable (e.g., number of years, months, hours, etc.) and the Y value is the dependent variable (e.g., asset value by year, cost of living per month, production per hour, etc.).

The determination coefficient expresses the 'goodness of fit' of the trend line through the data values, where a factor of 1 (or -1) means a perfect fit, and a factor of 0 means a random pattern of data values and no correlation to the trend line.

The data can be entered in any order, except that the first X-value must not be zero.

General Routine:

- 1) Press **CLEAR**
- 2) Key in first X value, press **STO** **TL**
Key in corresponding Y value, press **TL**
- 3) Repeat step 2 for each data pair.
- 4) Press **TL** **CAL** to print the coefficient, slope, and Y-axis intercept point.

To find an unknown point on the trend line:

- 5) Key in the corresponding X value, press **n**
- 6) Press **TL** to print the predicted Y value.

Example: The Customer Service Dept. for the Hunt-n-Peck Typewriter Co. wishes to predict the future repair costs for its newest product, based on these incomplete records:

Month (X-variable)	Repair Costs (Y-variable)
1	\$750
2	?
3	\$810
4	\$730
5	?
6	\$590

To calculate a trend line from the above values,

Enter:

The results are shown in the following graph.

Log Trend Line

Calculates a logarithmic trend line (by the least-squares linear regression method) including the determination coefficient, slope, and Y-axis intercept. This routine is a combination of the special LOG key and either the Trend Line or the Expanded Trend Line routine.

General Routine:

- 1) Find the log of each Y-value by keying in the value and pressing . All Y_{\log} values must be calculated before starting the trend line routine.
- 2) Now use those Y_{\log} values to perform either trend line routine.
- 3) To convert each result back to a natural number,
 - a) Press 10 **SAVE**↑
 - b) Key in the log result, press .

Glossary

A *bond* is a written agreement to pay a sum of money, called the face value or redemption value, plus periodic interest payments, called *coupons*, over the life of the bond.

A bond may be purchased at its face value (at *par*), below the face value (at a *discount*) or above the face value (at a *premium*). An investor's willingness to buy a bond at other than face value depends largely on the interest rate (and thus the effective yield) that the bond should bring. The value of a bond is almost invariably expressed in multiples of \$100.

The *yield* of a bond is computed as a combination of the percentage of interest paid and the difference (if any) between the purchase price and the redemption price. For example, if a 5-year bond for \$100 is purchased for \$95 and has a coupon rate of 5%, the effective annual yield will be approximately 6% since the extra \$5 realized at redemption adds an extra 1% per year to the yield.

A *callable bond* is one which may be redeemed on a specified date before maturity (the *call date*) at a specified price (the *call price*).

The *settlement price* of a bond or note is its value on the day before the issue is traded. This date is the *settlement date*.

A *note* is a written agreement to pay a sum of money plus interest at a certain rate. Notes do not have periodic coupons, since all interest is paid at maturity. They may be purchased at par, at a discount, or at a premium.

For after-tax computations, the interest or coupon payments are considered income, while the difference between bond or note face value and its purchase price is considered capital gains.

Entering Days

The entries for the number of days (to maturity, to call, etc.) may be made in either of two ways:

- If the actual number of days is known, it may be entered.
- If the transaction dates are known, they may be entered in the month-day-year format (mm.ddyyyy), to permit the HP-81 to calculate the number of days between the two dates.

Data-Entry Keys

The bond and note routines use these keys:

Number of days → **STO** **DAY** and/or **n**

Yield → **i**

Interest or Coupon Rate → **PMT**

Note or Bond Price → **PV**

Call Price → **FV**

NOTE

Press **CLEAR** before starting each Bond or Note calculation. Also, you may list the modes currently set by pressing

PRM **◊** .

Bond Price

To calculate the price of a bond given the settlement date, maturity date, effective yield to maturity, and the coupon rate:

- 1) Press **CLEAR**
- 2) See page 125 to set desired modes (Bond mode *must* be set).
- 3) Key in settlement date*, press **SAVE↑**
- 4) Key in maturity date*, press **DAY**
- 5) Key in yield to maturity (as a %), press **i**
- 6) Key in coupon rate (as a %), press **PMT**
- 7) To find the bond price, press **BND** **PV**.

Example: Find the price of a bond maturing on September 15, 1984 which has a yield of $6\frac{1}{4}\%$ and a coupon rate of 5%. The settlement date is November 2, 1973. (Use the Pre-tax mode, Semiannual Coupon mode, Actual-Day Month mode, and 365-Day Year mode).

Since all the required modes are automatically set when the HP-81 is switched ON,

Enter: **CLEAR**

11.021973 **SAVE↑** 9.151984 **DAY**
 6.25 **i** 5 **PMT** **BND** **PV**

```

```

*If the number of days (in the proper days/month and days/year mode) from settlement to maturity is known, that may be entered with **STO** **DAY**, in place of steps 2 and 3.

Bond Yield-to-Maturity

To calculate the yield of a bond given the settlement date, maturity date, bond price, and coupon rate:

- 1) Press **CLEAR**
- 2) See page 125 to set desired modes (Bond Mode *must* be set).
- 3) Key in settlement date*, press **SAVE↑**
- 4) Key in maturity date*, press **DAY**
- 5) Key in coupon rate (as a %), press **PMT**
- 6) Key in bond price, press **PV**
- 7) To find the bond yield, press **YTM**.

Example: Find the yield of a bond that matures on December 14, 1990 and has a price of 98.875 and a coupon rate of 4%. The settlement date is January 5, 1974. (Use the After-tax mode, Semiannual Coupon mode, Actual-day Month mode, and 365-day Year mode.)

To set the After-tax mode, store an income tax rate of 48%, and a capital gains rate of 30%,

Enter:

CLEAR **EXT()** **1**

48 **STO** **1** **30** **STO** **2**

Now Enter:

1.051974 **SAVE↑** 12.141990 **DAY**

4.75 **PMT** 98.875 **PV** **YTM**

Bond Price-to-Call

To calculate the current price-to-call of a bond, assuming a certain future call date and call price:

- 1) Press **CLEAR**
- 2) See page 125 to set desired modes (Bond mode *must* be set).
- 3) Key in the settlement date*, press **SAVE↑**
- 4) Key in the call date*, press **DAY**
- 5) Key in the yield-to-call rate (as a %), press **i**
- 6) Key in the coupon rate (as a %), press **PMT**
- 7) Key in the call price, press **FV**
- 8) To find the price-to-call, press **BND** **PV**.

Example: Find the price-to-call of a bond with a call price of 105.75 and a call date of May 20, 1978. The bond yield-to-call rate is 5½% and coupon rate is 5¼%. The settlement date is November 16, 1973. (Use the modes automatically set.)

Enter: **CLEAR**

11.161973 **SAVE↑** 5.201978 **DAY**

5.5 **i** 5.25 **PMT**

*If the number of days (in the proper day/month and day/year mode) from settlement to call is known, this may be entered with **STO** **DAY**, in place of steps 2 and 3.

Bond Yield-to-Call

To calculate the yield-to-call of a bond, given the settlement date, call date, coupon rate, bond price, and call price:

- 1) Press **CLEAR**
- 2) See page 125 to set desired modes (Bond mode *must* be set).
- 3) Key in settlement date*, press **SAVE↑**
- 4) Key in call date*, press **DAY** **n**
- 5) Key in coupon rate (as a %), press **PMT**
- 6) Key in bond price, press **PV**
- 7) Key in call price, press **FV**
- 8) To find the yield-to-call rate, press **YTM** **i**.

Example: Find the yield-to-call of a bond with a price of 104.125, a call date of July 10, 1981, a coupon rate of 7¼%, and a call price of 103. The settlement date is November 19, 1973. (Use the calculating modes automatically set.)

Enter: **CLEAR**

11.191973 **SAVE↑** 7.101981 **DAY** **n**

*If the number of days from issue to maturity is known, it may be entered with **n**, in place of steps 2 and 3.

†If the number of days from settlement to maturity is known, it may be entered with **STO** **DAY**, in place of steps 4 and 5.

Note Yield-before-Maturity

To calculate the yield of a note (be sure to enter dates in this order):

- 1) Press **CLEAR**
- 2) See page 125 to set desired modes (Note mode *must* be set).
- 3) Key in issue date*, press **SAVE↑**
- 4) Key in maturity date*, press **DAY** and **n**
- 5) Key in settlement date†, press **SAVE↑**
- 6) Key in maturity date again†, press **DAY**
- 7) Key in interest rate (as a %), press **PMT**
- 8) Key in settlement price, press **PV**
- 9) To find the note yield, press **YTM** **i**.

Example: Find the yield of a 90-day note having a settlement price of \$100, and an interest rate of 7%. The maturity date is February 20, 1974, and settlement date is January 21, 1974. (Use all modes automatically set except the Note mode.)

Enter: **CLEAR**

EXT() **9** (Note mode)

†If the number of days from settlement to maturity is known, it may be entered with

STO **DAY**, in place of steps 4 and 5.

Discounted Note

To calculate a note's discount amount (interest) and effective annual yield:

- 1) Press **CLEAR**
- 2) Set the desired days-per-year mode (see page 125)
- 3) Key in the issue date*, press **SAVE↑**
- 4) Key in the maturity date*, press **DAY** and **n**
- 5) Key in the annual interest rate (as a %), press **i**
- 6) Key in the note face value, press **FV**
- 7) Press **PMT** .

To find the results in the alternate days-per-year mode:

- 8) Press **R↓** **R↓** for the discount amount
- 9) Press **R↓** again for the effective annual yield.

Example: What is the discount amount on a \$1000 note (face value) having 37 days until maturity at 6%? What is the effective annual yield?

Enter:

CLEAR **EXT()** **7** (365-day Year mode)

37 **n** 100 **FV** 6 **i**

PMT

*If the number of days from issue to maturity is known, it may be entered with **n** , in place of steps 2 and 3.

Coupon-Equivalent Yield

This routine is useful for comparing discounted notes with bonds. The purchase price must be accurate to 4 decimal places, to insure that the answer is usable.

To calculate the yield of a discounted note as if it were a bond selling at par with semiannual coupons:

- 1) Set the rounding format by pressing  **4**
- 2) Key in the settlement date*, press **SAVE↑**
- 3) Key in the maturity date*, press **DAY**
- 4) Key in the note purchase price, press **PV**
- 5) To find the note's coupon-equivalent yield, press **EXT(1)** **8**.

Example: What is the coupon-equivalent yield of a U.S. Treasury bill which has 230 days to maturity and a price of 95.815?

Enter:

 **4**

230 **STO** **DAY** **95.815** **PV**

EXT(1) **8**

230.0000	→4*
95.8150	→P
YIELD	
6.8826	

*If the number of days from settlement to maturity is known, it may be entered with

STO **DAY**, in place of steps 2 and 3.

Retail Price *p.* 91

Regular Discount *p.* 92

Chain Discount *p.* 93

The basic function keys on the HP-81 are used to perform many otherwise long and tedious calculations. The Marketing routines are good examples of the use of the $\boxed{\%}$ key (also see 'Percentage Calculations' on page 14).

The following term may need some explanation.

A *chain discount* is the trade term for a series of discount percentages applied to the retail price to determine the discount price. The first percentage is applied to the retail price, the second percentage is applied to this result, and the third percentage is applied to the second result to give the final discount price. Note that, for example, a chain discount of 20%/10%/5% results in a different discount price than a regular discount of 35%.

Retail Price

The retail price of an item is calculated on a cost-plus-profit basis. The gross profit (or margin) is usually computed as a percentage of the retail price, rather than a percentage of the cost.

To find the price of an item:

- 1) Press $\boxed{1}$ **SAVE**↑
- 2) Key in the profit margin (as a decimal fraction),
press $\boxed{-}$ $\boxed{\text{STO}}$ $\boxed{0}$
- 3) Key in item cost, press $\boxed{\div}$ $\boxed{\div}$.
÷K
- 4) Repeat step 3 to find the cost of other items with the same profit margin.

Example: Find the retail price of items costing \$10.50, \$14.25 and \$4.50, with a required profit margin of 35%.

Enter:

1  .35   

10.5 

14.25 

4.5 

1.00	↑
.35	−
	→0
10.50	N +
16.15	◇
14.25	N +
21.92	◇
4.50	N +
6.92	◇

The selling prices are:

\$16.15

\$21.92

\$ 6.92

Regular Discount

To find the discount amount and selling price of an item:

- 1) Key in original price of item, press **SAVE↑**
- 2) Key in discount rate (as a %), press 
- 3) To print the discount selling price, press  .

Example: What is the selling price of an item costing \$44.95 at a 35% discount?

Enter:

44.95  35   

44.95	↑
35.00	%
15.73	−
29.22	◇

The discount amount is \$15.73 and the selling price is \$29.22.

Chain Discount

To find the selling price, based on a chain discount rate:

- 1) Key in the original price of item, press **SAVE↑**
- 2) Key in first discount rate (as a %), press **%** **—**
- 3) Repeat step 2 for each successive discount rate.
- 4) To print the discount selling price, press **◇**.

Example: What is the discount price of an item with a retail price of \$324.85, at a chain discount of 20%/10%/5%?

Enter:

324.85 **SAVE↑** 20 **%** **—**
 10 **%** **—** 5 **%** **—** **◇**

The discount price is \$222.20.

324.85	↑
20.00	%
64.97	—
10.00	%
25.99	—
5.00	%
11.69	—
222.20	◇

- A. INSPECTION AND TURN-ON PROCEDURES *p. 97*

- E. CALCULATING MODES *p. 125*

INSPECTION AND TURN-ON PROCEDURES

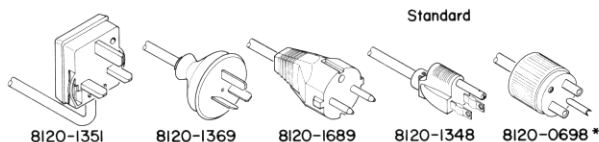

Please check to see that all the accessories listed below are present when unpacking your HP-81. Also, inspect the calculator for damage which may have occurred during shipment. If you find any damage or if any accessories listed are missing, you should file a claim with the carrier and contact the nearest -hp- Sales and Service Office listed on pages 112 — 113.

Accessories

Each HP-81 is furnished with these basic accessories:

DESCRIPTION	-hp- PART NUMBER
Operating Guide	00081-90000
Pocket Reference Guide	00081-90001
Printer Paper (2 rolls)	9281-0415
Printer ribbon	9282-0511
Power Cord	(See Below)
Dust Cover	4040-0528
Spare Fuses:	
½A, 250V, slo-blo	2110-0202
¼A, 250V, slo-blo	2110-0201
Travel Case	5061-0707

Power cords with different plugs are available for the calculator. Each plug, together with the part number of the power cord which has that plug, is shown below. The cord packaged with each calculator depends upon where that calculator is to be delivered. If your calculator has the wrong power cord for your area, please contact the nearest -hp- Sales and Service Office.

*Approved by U.L. for either 220V or 240V operation in the United States.

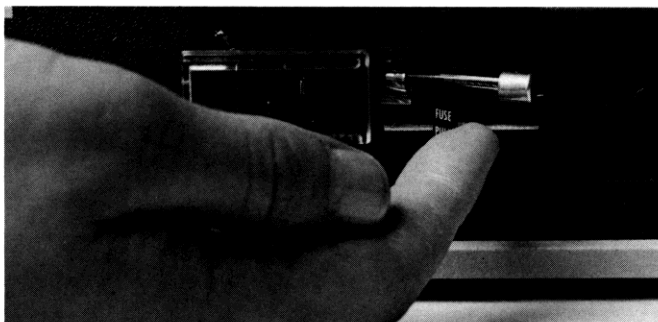

Turn-on Procedure

1. Before connecting the power cord to the back of your calculator check the setting of the voltage selector card in the power module (see the following photographs). The number visible indicates which voltage is set. The HP-81 operates on power line frequency of between 48 and 66 Hz. If the card is set to the available power line voltage, you may skip the next step and go to step 3.

CAUTION

THE HP-81 CAN BE DAMAGED IF IT IS SWITCHED ON WHEN NOT SET TO THE CORRECT LINE VOLTAGE.

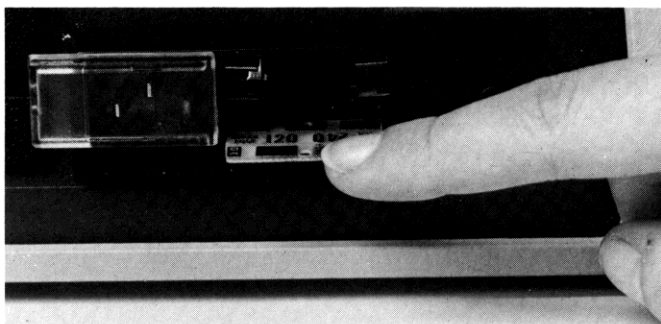

2. To reset the voltage selector card:

- a. Slide the plastic window on the power module completely to the left; then remove the fuse by moving the FUSE PULL lever to the left.

- b. Pry the voltage selector card out (use a pointed tool such as a ball-point pen) and re-insert it so that the number representing the available line voltage is readable.

- c. Move the FUSE PULL lever to the right and insert the correct fuse for the new line voltage setting. Then slide the plastic window back to the right.

NOTE

For 120V ac operation, use a $\frac{1}{2}$ A. fuse

For 240V ac operation, use a $\frac{1}{4}$ A. fuse

3. Plug the power cord into the back of the calculator and into a suitable power outlet. The calculator requires a maximum of 40 voltamps.
4. Turn your calculator ON by pressing the **POWER** switch. Each time the HP-81 is switched-on, the word 'CLEAR' is printed (provided **PRT OFF** is released). To switch-off the calculator, merely press **POWER** again.

Your calculator meets current NEMA (National Electrical Manufacturers' Association) grounding standards provided that a 3-conductor power cord is used to supply power to the calculator from a suitably grounded outlet.

If your calculator does not operate as described above when switched on, see 'Service' (Appendix C).

OPERATING LIMITS**Calculator Range**

The HP-81 handles numbers up to 10^{100} . Calculations or data entries exceeding that range are indicated by 'NOTE 1' (and displayed as *9.99999999 99*). The calculator also handles numbers as small as 10^{-99} . Calculations or data entries exceeding that range are printed (and displayed) as zero.

Accuracy

The accuracy of the HP-81 varies according to the operation being performed. Arithmetic operations and simple functions (+, -, X, ÷, %, Δ%, Σ+, Σ-, ÷K, xK) are accurate to within ±1 count in the 10th (least significant) digit.

Special functions (LOG, Y^X , \sqrt{X} , x) are always accurate to not less than 9 digits — the accuracy is due to rounding error and depends upon the individual problem.

Special routines solved through an iterative method (bond yields, effective annual yield, rate conversion problems, etc.) are accurate to not less than 5 digits.

Operating Errors

Improper number entries, key sequences, and calculations are indicated by printed 'NOTES' and a flashing display (if installed). A list of operating notes is at the back of this guide, and under the calculator top-cover.

Temperature Range

Operating and Storage: 0° to 45°C (32° to 113°F)

SERVICE and MAINTENANCE

Checkout Procedure

If the calculator fails to turn ON properly, check these possible causes:

1. Is the calculator set to operate on the correct line voltage?
2. Is the fuse burned out? (Look for a broken filament inside the fuse.) Follow steps 2a and 2c of the 'Turn-on Procedure' when checking or replacing the fuse.

Should the calculator print anything but 'CLEAR' when it is switched ON, carefully press the following sequence of keys and compare the results with those shown.

A. Preliminary Checkout

1. Switch **PRT OFF** UP and **DECIMAL** DOWN.
2. Press: **CLEAR** 0.00
3. Press: **9** **-** 0.00000000 00
4. Press: 123.456789 **SAVE** 1.234567890 02
5. Press: **y^x** 9.99999999 99
(flashing)
6. Press: **CHS** **◇** -9.99999999 99

If, after repeated attempts, your results fail to duplicate those shown, return your calculator according to the Shipping Instructions on page 107.

If you suspect the operation of a particular routine, perform any of the following checkouts related to that routine. Carefully go through each key sequence and compare your printout with the sample shown.

If your printout results do not duplicate the sample, or if the calculator has a problem not checked by the above procedures (for example, if the POWER
OFF switch does not lock in place), return the calculator according to the following instructions.

Warranty

The HP-81 is warranted against defects in materials and workmanship, as described by the HP-81 Technical Data Sheet. During the warranty period, we will repair or replace components that prove to be defective, provided that the HP-81 is returned to HP according to the following Shipping Instructions.

Beyond the stated warranty period, your calculator will be repaired for a moderate charge. Again, return the calculator according to the Shipping Instructions.

With regard to the HP-81 pre-programmed routines, we make no express or implied warranty of any kind, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. HP shall not be liable for incidental or consequential damages in connection with or arising out of the furnishing, performance, or use of those routines.

Shipping Instructions

Please be sure that all items are protectively packed to avoid damage while in transit. Such damage would not be covered by warranty. Also, you should insure your shipment.

When returning your calculator for service:

1. Remove the roll of printer paper and the spindle.
2. Include a completed Service Card with the calculator. The card is kept in the reference-book pocket (look under the calculator top-cover). When filling out the Service Card, be sure to indicate the checkout sequences you have completed and briefly describe the calculator problem.
3. Pack the calculator in the travel case.
4. Carefully pack the travel case in a larger cardboard box.
5. Return your calculator to the nearest service location listed on pages 112-113 and mark it, **Attention: Customer Service.**

If you prefer, you can return the calculator to the factory, by sending it to this address:

Hewlett-Packard
815 14th Street S.W.
Loveland, Colorado 80537
Attn: Calculator Service

If you have any questions or problems regarding calculator service, please call the nearest -hp- Sales and Service Office.

Replacing Printer Paper

Your HP-81 is furnished with two rolls of printer paper. If you wish to purchase paper other than that supplied by -hp-, many replacement products are available — just be sure to specify 2¼" wide, adding machine paper.

When replacing the printer paper:

1. Be sure to remove any remaining old paper before loading the new roll.
2. Insert the free end of the new paper as shown below, press the **PAPER ↑** key, and guide the advancing paper under the paper tear-off bracket.

Replacing the Ribbon

The printer ribbon supplied should give many months of reliable service, but when the printout becomes light or intermittent, the ribbon needs replacing. Any adding machine ribbon equivalent to the ribbon supplied with the calculator or either of the products listed below can be used as a replacement.

General Ribbon Co., type E200, black and red intense ribbon.

Columbia Ribbon Co., type 43, black-red record, double-spool ribbon.

When replacing the printer ribbon:

1. Notice the path of the old ribbon before removing it (see drawing below).
2. Be sure the black portion of the new ribbon is *up* when installed.
3. Press **PAPER ↑** to draw the ribbon taut before closing the calculator top-cover.

Cleaning the Printer

To ensure clear printouts, we recommend that the printer be cleaned at least every 3 months. The only equipment needed to clean the printer is a brush (any small, stiff-bristled brush will do) and a small amount of denatured (isopropyl) alcohol.

To clean the printer:

1. Remove the printer paper; then lift up the paper tear-off bracket and lift off the small, metal cover plate (see photo below).
2. Remove the ribbon and inspect it for wear; if it looks frayed or perforated – install a new one later.
3. Slide a strip of printer paper (about 6" long) under and around the metal print drum as shown in the photograph. This paper will catch any particles brushed from the print drum.

4. Use the stiff-bristled brush and a small amount of alcohol to clean each character on the print drum.

CAUTION

BE SURE NOT TO SPILL ALCOHOL ON ANY OF THE OTHER COMPONENTS.

5. After you've cleaned the drum, fold the paper as shown and slowly pull the paper back out from under the drum. Now blow any dust or remaining ribbon particles out of the printer.
6. Replace the small cover plate; snap the paper tear-off bracket back into place, replace the ribbon and the printer paper.

Cleaning the Calculator

Your HP-81 can be cleaned with a soft cloth dampened either in clean water or in water containing a mild detergent. Do not use an excessively wet cloth nor allow water to penetrate inside the calculator. Also, do not use any abrasive cleaners, especially on the display window.

EQUATIONS

Compounded Amount

Future Value

$$FV = PV (1 + I)^n$$

when: $I \neq 0$

Present Value

$$PV = FV (1 + I)^{-n}$$

when: $I \neq 0$

Number of Periods

$$N = \frac{\ln \left(\frac{FV}{PV} \right)}{\ln (1+I)}$$

when: $I \neq 0$

Rate of Interest

$$I = 100 \left[\left(\frac{FV}{PV} \right)^{\frac{1}{n}} - 1 \right]$$

APR Odd-Days Interest

This routine uses the same iterative process as for Rate of Interest for an Annuity, except that an odd days factor is entered via this equation:

$$P = \frac{N}{1 + \frac{N+n}{12} * \frac{AIR}{100}}$$

Where:

N = Number of monthly payments

n = (Number of odd days) $\times \frac{12}{365}$

AIR = Add-on interest rate, in percent.

Annuities

$$N = \frac{-\log \left(1 - \frac{PV \cdot I}{PMT} \right)}{\log (1+I)}$$

$$N = \frac{\ln \left(\frac{FV \cdot I}{PMT} + 1 \right)}{\ln (1+I)}$$

Future Value

$$FV = PMT \frac{(1+I)^N - 1}{I}$$

when: $I \neq 0$

$$FV = N(PMT)$$

when: $I = 0$

Present Value of an Annuity

$$PV = PMT \frac{1 - (1+I)^{-N}}{I}$$

when: $I \neq 0$

$$PV = N(PMT)$$

when: $I = 0$

Payment Amount of a Sinking Fund

$$PMT = FV \frac{I}{(1+I)^N - 1}$$

when: $I \neq 0$

$$PMT = \frac{FV}{N}$$

when: $I = 0$

Payment Amount of an Annuity

$$PMT = PV \frac{I}{1 - (1+I)^{-N}}$$

when: $I \neq 0$

$$PMT = \frac{PV}{N}$$

when: $I = 0$

Rate of Interest of an Annuity

This problem uses an iterative routine based on:

$$X_{K+1} = X_K \left[1 + \frac{1 - \frac{(X_K - 1)P}{(1 - X_K^{-N})}}{\frac{N}{1 + X_K^N} + \frac{X_K}{X_K - 1}} \right]$$

when solving for FV: $P = PV/PMT$

when solving for PV: $P = -FV/PMT$, $N = -N$

Amortized Loan Schedule

For each payment period:

$$INT_{\lambda} = \frac{PV_{\lambda} (I)}{100}$$

$$PRIN_{\lambda} = PMT - INT_{\lambda}$$

$$PV_{\lambda+1} = PV_{\lambda} - PRIN_{\lambda}$$

$$INT_T = \sum_{\lambda=J}^K INT_{\lambda}$$

Where:

- J = First payment of schedule
- K = Last payment of schedule
- I = Interest Rate of loan (in percent)
- PMT = Payment amount
- INT_{λ} = Interest paid in the λ th payment
- $PRIN_{\lambda}$ = Principal paid in the λ th payment
- PV_{λ} = Remaining principle at the λ th payment
- INT_T = Total interest accumulated between first and last periods of schedule

Sum-of-the-Digits Method

This problem uses an iterative routine based on these equations:

$$PV_{K+1} = PV_K - DEPR_K$$

$$DEPR_K = \frac{[N - K + 1]}{N(N+1)/2} PV_0$$

Where:

PV_K is the remaining book value after the K^{th} depreciation period.

N is the number of depreciation periods in the life of the asset.

PV_0 = Principle amount of loan

Declining-Balance Depreciation (iterative solution)

$$PV_{K+1} = PV_K - DEPR_K$$

$$DEPR_K = M(PV_K)$$

$$M = \frac{DCL \ FCTR}{N}$$

Where:

PV_K is the remaining book value after the K^{th} depreciation period.

$DEPR_K$ is the amount of depreciation in the K^{th} period.

M is the multiplier

$DCL \ FCTR$ is the declining factor.

N is the number of periods in the life of the asset.

Depreciation

This routine has the same solution as the Declining-Balance Depreciation routine except that the DCL factor must be calculated from the data given.

$$M = \frac{DCL \ FCTR}{N}$$

$$DCL \ FCTR = -N \left[\left(\frac{FV}{PV} \right)^{1/N} - 1 \right]$$

FV = salvage value of asset

PV = initial value of asset

N = number of depreciation periods in life of asset.

Cash-Flow Analysis

Annual Interest Rate to Nominal Rate

$$I = 100 [(1+i)^{1/N}-1]$$

Discounted Rate of Return

This routine uses an iterative technique to solve for IRR. The basic defining equation is:

$$0 = -I + \sum_{j=1}^n C_j(1+i)^{-j}$$

Where:

n is the number of cash flows.

C_j is the j^{th} cash flow.

$-I$ is the initial investment.

i is the discounted rate of return.

After e^r (r = continuous rate of return) is substituted for $1 + i$, the final equation for Discounted ROR is:

$$I = \sum_{j=1}^n C_j e^{-jr}$$

Statistics

Mean and Standard Deviation

$$\bar{X} = \frac{\sum x}{N}$$

where:

n = number of X values

$$S_x = \sqrt{\frac{1}{n-1} (\sum x^2 - n\bar{x}^2)}$$

Trend Line

$$\text{Slope} = \frac{\frac{2}{1} \sum_{k=1}^n K Y_k - (n+1) \sum_{k=1}^n Y_k}{n(n^2 - 1)/6}$$

$$\text{Intercept} = \left[\frac{1}{n} \sum_{k=1}^n Y_k - \frac{n+1}{2} \right] \text{slope}$$

$$r^2 = \frac{(UXY)^2}{(UY^2)(UX^2)}$$

where: N = number of data points.

$$UXY = \sum XY - \frac{(\sum x)(\sum y)}{N}$$

$$UX^2 = \sum X^2 - \frac{(\sum X)^2}{N}$$

$$UY^2 = \sum Y^2 - \frac{(\sum Y)^2}{N}$$

Bonds

Definitions

P = bond price

i = bond yield

c = coupon rate, in percent

j = 1 — fractional part of $\left(\frac{a}{b}\right)$

n = life of bond in days

a = 1 (annual coupon)

2 (semiannual coupon)

b = 360 (360-day basis)

365 (365-day basis)

Bond Price

- 1) When the life of the bond is greater than the coupon period:

$$PV = 100\left(1 + \frac{i}{a}\right)^{\frac{an}{b}} + \frac{c}{\left(\frac{FV}{100}\right)^i} \left[\left(1 + \frac{i}{a}\right)^j - \left(1 + \frac{i}{a}\right)^{\frac{-an}{b}} \right] - \frac{cj}{a\left(\frac{FV}{100}\right)}$$

$$P = PV \left(\frac{FV}{100} \right)$$

- 2) When the lift of the bond is less than the coupon period:

$$PV = \frac{\left[\frac{100 + \frac{100NC}{aFV}}{1 + \frac{Ni}{a}} \right] - \frac{N}{a} \left[\frac{c100}{aFV} \right] (1-N)}{1 + \frac{Ni}{a}}$$

$$P = PV \left(\frac{FV}{100} \right)$$

Bond Yield

Bond Yield is found by using the above equations to solve for i .

Notes

Definitions

P = note price

R = note yield

$N = \left(\frac{\text{settlement to maturity}}{\text{basis}} \right)$

$M = \left(\frac{\text{issue to maturity}}{\text{basis}} \right)$

c = interest rate of note.

Note Price

$$PV = \frac{100 + NC - NRC (M-N)}{1 + NR}$$

$$P = PV \left(\frac{100}{100} \right)$$

Note Yield-to-Maturity

$$R = \frac{1}{N} \left[\frac{\frac{100}{P} + \frac{MC}{P}}{1 + \frac{C}{P}(M-N)} - 1 \right]$$

Coupon-Equivalent Yield

1) When one or less days to maturity:

$$CEY = \left(\frac{100}{P} - 1 \right) \frac{200}{N}$$

2) When more than one day to maturity:

$$CEY = \left[\left(\frac{N}{2} + (1-N) \left(1 - \frac{100}{P} \right) \right)^{1/2} \frac{-N}{2} \right] \frac{200}{N-1}$$

$$\text{Where: } N = \frac{n}{182.5}$$

n = no. of days to maturity

After-Tax Calculations

The After-tax mode only applies to bond and note calculations. The two taxes of concern are the personal tax rate (p%) and the corporate tax rate (C%). C% and p% are decimal numbers, i.e., 30% = .30 .

In the bond price equation, the following changes are made:

$$\text{when } n < \frac{b}{a}$$

$$C(1 - P\%) \rightarrow C$$

$$P_{\text{new}} = \frac{P_{\text{old}} - FV(C\%)(1 - \frac{ni}{b})}{1 - (C\%)(1 - \frac{ni}{b})}$$

$$\text{when } n \geq \frac{b}{a} :$$

$$C(1 - P\%) \rightarrow C$$

$$P_{\text{new}} = \frac{P_{\text{OLD}} - FV(C\%)(1 + \frac{i}{a}) - \frac{na}{b}}{1 - (C\%)(1 + i/a) - \frac{na}{b}}$$

Discounted Note

For 360-day Year basis:

$$DISC_{360} = \frac{NI(FV)}{36000}$$

$$Yield_{360} = \frac{DISC_{360}(36000)}{n(FV - DISC_{360})}$$

For 365-day Year basis:

$$DISC_{365} = DISC_{360} \frac{360}{365}$$

$$Yield_{365} = \frac{DISC_{365}(36500)}{n(FV - DISC_{365})}$$

CALCULATING MODES

The HP-81 calculating modes offer considerable flexibility when using some routines. The required mode settings are listed at the beginning of each of those routines.

Each mode must be set before the routine is started; although, in most cases, the result can be recalculated by simply changing the mode setting and pressing the final key-sequence again.

To print a list of the calculating modes currently set, press   .
PRM

Pre-tax* or After-tax Mode

The mode set determines whether answers for several bond routines are calculated on a Pre-tax or After-tax basis.

For the After-tax mode, two tax rates must be stored:

1. Key in the individual or corporate income tax rate (as a %), press  .
2. Key in the capital gains tax rate (as a %), press  .

The HP-81 assumes long-term capital gains. If the bond is purchased above par, the capital gains rate should be entered as 0.

Annual or Semiannual* Coupon Mode

The mode set determines whether a bond calculation includes an annual or semiannual coupon rate.

*This mode is automatically set when the HP-81 is switched ON.

30-day or Actual-day* Month Mode

The mode set determines whether bond, note, accrued interest, DAY and DATE calculations are based on the Banker's month of 30 days or on the actual number of days in each month.

Rules for the 30-day month are:

1st to 30th of same month is 29 days

1st to 31st of same month is 30 days

1st to 1st of following month is 30 days

30th or 31st to 1st of following month is 1 day

30th or 31st to 30th of following month is 30 days

30th or 31st to 31st of following month is 30 days

1st to 28th of February is 27 days

1st to 29th of February is 28 days

1st of February to 1st of March is 30 days

360-day or 365-day* Year Mode

The mode set specifies either a 360-day year or 365-day year for bond, note, and interest calculations. This mode setting does not affect Calendar functions (see page 19).

Bond* or Note Mode

The mode set specifies the proper instrument of exchange for the appropriate calculations. The Bond Mode assumes that periodic payments (coupon payments) are made, while the Note mode assumes that only a final payment is made.

* This mode is automatically set when the HP-81 is switched ON.

Here is how to set each mode (setting one of each pair resets the other):

To set this mode:	Press:	Printout:
Pre-tax*	 EXT() 0	P R E TX0
After-tax†	 EXT() 1	AFT TX1
Annual Coupon	 EXT() 2	AN2
Semiannual Coupon*	 EXT() 3	SEM AN3
30-day Month	 EXT() 4	D A Y 360 4
Actual-day Month*	 EXT() 5	D A Y 365 5
360-day Year	 EXT() 6	B A 360 6
365-day Year*	 EXT() 7	B A 365 7
Bond*	 EXT() 8	BON 8
Note	 EXT() 9	N O T E 9

*These modes are automatically set when the HP-81 is switched ON.

†When using the After-tax mode, the income tax rate must be stored in register 1 and the capital gains rate must be stored in register 2.

Changes

HP-81 CALCULATOR Operating Guide

- Page 14:** Near the bottom of the page, change the word "edit" to "added".
- Page 26:** In steps c) and d), change the "-" signs to "÷" signs.
- Page 30:** In step 4, change the word "payment" to "principal".
- Page 39:** Add this title to the listing:

Payment Amount for a Sinking Fund p. 44

- Page 46:** In the first sentence, change the word "present" to "future".
- Page 52:** Change the NOTE to read:
The current rounding format affects each calculated depreciation amount.
- Page 70:** Draw a radical sign ($\sqrt{\quad}$) over the entire equation in the footnote.
- Page 71:** The printout should appear like this:

	84.00	Σ-
	47.00	Σ-
σ	5.74	
N	8.00	
X	64.13	

Also, delete "(or -1)" from the next paragraph.

- Page 72:** Add a π key after entering 58 in the example.
- Page 74:** In the third paragraph, delete "(or -1)".
- Page 75:** The key sequence at the bottom of the page should be:

7 π π 12 π π

Pages 81-87: For each footnote, delete the phrases: "in place of steps 2 and 3" and "in place of steps 4 and 5".

Page 83: Change the last key in the example from  to .

Page 87: In step 6, change the word "face" to "par".

Page 99: Change the NOTE to:

For 100 or 120vac operation, use a $\frac{1}{2}$ A. fuse.

For 220 or 240vac operation, use a $\frac{1}{4}$ A. fuse.

Page 101: Change the stated accuracy for the Y^X function from 9 digits to 7 digits.

Page 122: Correct the Coupon-Equivalent Yield titles to indicate:

- 1) When less than 6 months to maturity:
- 2) When more than 6 months to maturity:

Inside-Back Cover: Correct the definition of NOTE 4 to : "... where starting period for the schedule is ≤ 0 ".

ERROR NOTES

When an error is encountered, the display (if installed) will blink continuously. Press either **CE** or **CLEAR** before correcting the error.

NOTE 1 Number beyond the range of the calculator.

NOTE 2 Insufficient or unusable data for these routines:

- a. Compound Interest routines
- b. Bond Yield to Maturity
- c. Discounted Note
- d. Accrued Interest

NOTE 3 DAY or DATE error:

- a. outside the calendar range (January 1, 1901 — December 31, 2099)
- b. an incorrect format
- c. an improper 360-day year calendar date

NOTE 4 Length of time-period error (with **STO** **1** and **STO** **2**), where the period keyed in is less than one time-period.

NOTE 5 Math error:

- a. division by zero
- b. $\log_{10} X$ where X is less than or equal to zero
- c. Y^X where Y is less than or equal to zero
- d. \sqrt{X} where X is less than or equal to zero.

NOTE 6 Cash Flow Analysis error:

- a. positive initial investment
- b. more than nine cash flow entries, or none at all
- c. outlays mixed in with inflows
- d. more than 100 individual calculations required.

NOTE 7 Math error associated with Bond, Yield-to-Maturity, or Interest calculations.

NOTE 8 More than 19 entries for the Total and Percentage routine.

NOTE 9 Horizontal trend line.
