

HEWLETT-PACKARD

HP-41C

SURVEYING PAC

NOTICE

Hewlett-Packard Company makes no express or implied warranty with regard to the keystroke procedures and program material offered or their merchantability or their fitness for any particular purpose. The keystroke procedures and program material are made available solely on an "as is" basis, and the entire risk as to their quality and performance is with the user. Should the keystroke procedures or program material prove defective, the user (and not Hewlett-Packard Company nor any other party) shall bear the entire cost of all necessary correction and all incidental or consequential damages. Hewlett-Packard Company shall not be liable for any incidental or consequential damages in connection with or arising out of the furnishing, use, or performance of the keystroke procedures or program material.

INTRODUCTION

The programs in this Surveying Pac have been chosen to aid surveyors in calculations for many of their often encountered problems. Each program in this pac represents a program in the Application Module and a section in this manual. The manual provides a description of the program with relevant equations, a set of instructions for using the program, and one or more example problems, each of which includes a list of the keystrokes required for its solution.

Before plugging in your Application Module, **turn the calculator off**, and be sure you understand the section Inserting and Removing Application Modules. And before using a particular program, take a few minutes to read Format of User Instructions and A Word About Program Usage.

You should first familiarize yourself with a program by running it once or twice while following the complete User Instructions in the manual. Thereafter, the program's prompting or the mnemonics on the overlays should provide the necessary instructions, including which variables are to be input, which keys are to be pressed, and which values will be output. A quick-reference card with a brief description of each program's operating instructions has been provided for your convenience.

We hope the Surveying Pac will assist you in the solution of numerous problems in your discipline. If you have technical problems with this Pac, refer to your HP-41 owner's handbook for information on Hewlett-Packard "technical support" or "programming assistance."

Note: Application modules are designed to be used in all HP-41 model calculators. The term "HP-41C" is used throughout the rest of this manual, unless otherwise specified, to refer to all HP-41 calculators.

CONTENTS

Introduction	1
Contents	2
Inserting and Removing Application Modules	4
Format of User Instructions	6
A Word about Program Usage	8
Traverse, Inverse and Sideshots	10
Reduces field traverse data for both bearing/azimuth traverses and field angle traverses. Routines for slope distances, inverses and curved sides are included. A Closure routine with area calculation is also included. Sideshots may also be performed.	
Compass Rule Adjustment	30
Adjusts the coordinates of a traverse by the Compass or Bowditch rule.	
Transit Rule Adjustment	34
Adjusts the coordinates of a traverse by the transit rule method.	
Intersections	38
Calculates the coordinates and other data for the point of intersection of bearing-bearing, bearing-distance, distance-distance intersections and an offset from a point to a line.	
Curve Solutions	44
Calculates 8 parameters of a circular curve given any 2 of the parameters. Areas of the fillet, segment and sector of the curve are also calculated.	
Horizontal Curve Layout	48
Calculates field data for layout of a horizontal circular curve by any of four methods. Input of a stationing interval allows automatic calculation of data at successive stations.	
Vertical Curves and Grades	56
Calculates station and elevation data for vertical curves or straight grades. Input of a stationing interval allows automatic calculation of data at successive stations.	
Resection	60
Solves the resection or "three point" problem to locate a point by means of three known points.	

Predetermined Area	64
Calculates the location of one side of a parcel of land in order to enclose a specified area. The land parcel may be triangular or trapezoidal in shape.	
Volume by Average End Area	70
Calculates cross-section area, interval volume, and accumulated volume for earthwork. The cross-sections must be all cut or all fill.	
Volume of a Borrow Pit	74
Calculates the volume of material that may be excavated from a borrow pit.	
Coordinate Transformation	78
Performs scaling, rotation and translation of coordinates from one system to a second.	
Appendix A: Program Data	82
Appendix B: Subroutines	83
Appendix C: Formulas and References	87
Appendix D: Program Labels	98

INSERTING AND REMOVING APPLICATION MODULES

Before you insert an application module for the first time, familiarize yourself with the following information.

Up to four application modules can be plugged into the ports on the HP-41C. While plugged in, the names of all programs contained in the module can be displayed by pressing  **CATALOG** 2.

CAUTION

Always turn the HP-41C off before inserting or removing any plug-in extensions or accessories. Failure to turn the HP-41C off could damage both the calculator and the accessory.

Here is how you should insert application modules:

1. Turn the HP-41C off! Failure to turn the calculator off could damage both the module and the calculator.

2. Remove the port covers. Remember to save the port covers, they should be inserted into the empty ports when no extensions are inserted.

3. With the application module label facing downward as shown, insert the application module into any port **after** the last memory module presently inserted.
4. If you have additional application modules to insert, plug them into any port after the last memory module. For example, if you have a memory module inserted in port 1, you can insert application modules in any of ports 2, 3, or 4. **Never insert an application module into a lower numbered port than a memory module.** Be sure to place port covers over unused ports.
5. Turn the calculator on and follow the instructions given in this book for the desired application functions.

To remove application modules:

1. Turn the HP-41C off! Failure to do so could damage both the calculator and the module.
2. Grasp the desired module handle and pull it out as shown.

3. Place a port cap into the empty ports.

Mixing Memory Modules and Application Modules

Any time you wish to insert other extensions (such as the HP-82104A Card Reader, or the HP-82143 Printer) the HP-41C has been designed so that the memory modules are in lower numbered ports.

So, when you are using both memory modules and application modules, the memory modules must always be inserted into the lower numbered ports and the application module into any port after the last memory module. When mixing memory and application modules, the HP-41C allows you to leave gaps in the port sequence. For example, you can plug a memory module into port 1 and an application module into port 4, leaving ports 2 and 3 empty.

FORMAT OF USER INSTRUCTIONS

The completed User Instruction Form—which accompanies each program—is your guide to operating the programs in this Pac.

The form is composed of five labeled columns. Reading from left to right, the first column, labeled STEP, gives the instruction step number.

The INSTRUCTIONS column gives instructions and comments concerning the operations to be performed.

The INPUT column specifies the input data, the units of data if applicable, or the appropriate alpha response to a prompted question. Data Input keys consist of 0 to 9 and the decimal point (the numeric keys), **[EEX]** (enter exponent), and **[CHS]** (change sign).

The FUNCTION column specifies the keys to be pressed after keying in the corresponding input data.

Whenever a statement in the INPUT or FUNCTION column is printed in gold, the **[ALPHA]** key must be pressed before the statement can be keyed in. After the statement is keyed in, press **[ALPHA]** again to return the calculator to its normal operating mode, or to begin program execution. For example, **[XEQ] CURVE** means press the following keys: **[XEQ] [ALPHA] CURVE [ALPHA]**.

The DISPLAY column specifies prompts and intermediate and final answers and their units, where applicable.

Above the DISPLAY column is a box, SIZE XXX, which specifies the minimum number of registers necessary to execute the program. Refer to pages 73 and 117 in the Owner's Handbook for a complete description of how to size calculator memory.

The following illustrates the User Instruction Form for *Resection*.

				SIZE: 016
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	Begin Resection program		[XEQ] RESECT	COORDS?
2	If coordinates of the three points are known, answer: Y and input coordinates of the three points. Then go to step 4.	Y	[R/S]	N1=?
		N1	[R/S]	E1=?
		E1	[R/S]	N2=?
		N2	[R/S]	E2=?
		E2	[R/S]	N3=?
		N3	[R/S]	E3=?
		E3	[R/S]	LA=?

STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
3	OR If coordinates of the three points are not known, answer: N and input distance between points 1 and 2, distance between points 2 and 3 and angle C.	N L1 L2 $\Delta C(D.MS)$	$\boxed{R/S}$ $\boxed{R/S}$ $\boxed{R/S}$ $\boxed{R/S}$	DIST1=? DIST2=? $\Delta C=?$ $\Delta A=?$
4	Input angle A and angle B	$\Delta A(D.MS)$ $\Delta B(D.MS)$	$\boxed{R/S}$ $\boxed{R/S}$ $\boxed{R/S} \uparrow$	$\Delta B=?$ $\Delta D=?$ $\Delta E=?$
5	If coordinates of the three points were input calculate coordinates of point P.		$\boxed{R/S} \uparrow$ $\boxed{R/S} \uparrow$	NP= EP=
6	In either case, distances 1 through 5 may be calculated.		$\boxed{R/S} \uparrow$ $\boxed{R/S} \uparrow$ $\boxed{R/S} \uparrow$ $\boxed{R/S} \uparrow$ $\boxed{R/S} \uparrow$	DIST1= DIST2= DIST3= DIST4= DIST5=
7	For a new case go to step 1.			

† This $\boxed{R/S}$ not necessary when calculator is operated with printer.

The user should first allocate (at least) 16 data storage registers (**SIZE**: 016) for use during program execution. To do this the keys \boxed{XEQ} \boxed{ALPHA} **SIZE** \boxed{ALPHA} 016 are pressed.

Program execution is begun by pressing \boxed{XEQ} \boxed{ALPHA} **RESECT** \boxed{ALPHA} . The calculator display shows **COORDS?**, asking whether or not the coordinates of the 3 points are known. If the coordinates are known the user replies by pressing Y $\boxed{R/S}$. The calculator then prompts for coordinate input, beginning with the display **N1=?**. The user then keys in the northing of the first point, presses $\boxed{R/S}$, sees the display **E1=?**, and inputs the easting of the first point, etc. until all coordinates have been input. The display then requests input for ΔA and ΔB (which are keyed in in D.MS mode). Following these inputs the calculator calculates and displays the values of angles D and E, the coordinates of the unknown point, P, and the distances 1 through 5. When the calculator is not attached to a printer the user presses $\boxed{R/S}$ after each output to go on to the next. If a printer is attached and turned on the results are printed automatically, with no need to press the $\boxed{R/S}$ key.

If the coordinates of the three points are not known, the user replies to **COORDS?** by pressing N $\boxed{R/S}$ and then follows the prompting **DIST 1=?** by inputting the distance from point 1 to point 2. Following further prompts the distance from point 2 to point 3, and the angles C, A and B are input. Outputs are obtained in the manner described above.

A WORD ABOUT PROGRAM USAGE

Catalog

When an Application Module is plugged into a port of the HP-41C, the contents of the Module can be reviewed by pressing  **CATALOG** 2 (the Extension Catalog). Executing the **CATALOG** function lists the name of each global label in the module, as well as functions of any other extensions which might be plugged

Overlays

Overlays have been included for some of the programs in this pac. To run the program, choose the appropriate overlay, and place it on the calculator.

The mnemonics on the overlay are provided to help you run the program. The program's name is given vertically on the left side. Blue mnemonics are associated with the key they are directly below when the overlay is in place and the calculator is in USER mode. Gold mnemonics are similar to blue mnemonics, except that they are above the appropriate key and the shift (gold) key must be pressed before the re-defined key. Once again, USER mode must be set.

ALPHA and USER Mode Notation

This manual uses a special notation to signify ALPHA mode. Whenever a statement on the User Instruction Form is printed in gold, the **ALPHA** key must be pressed before the statement can be keyed in. After the statement is input, press **ALPHA** again to return the calculator to its normal operating mode, or to begin program execution. For example, **XEQ** CURVE means press the following keys: **XEQ** **ALPHA** CURVE **ALPHA**. Refer to the back of the calculator for a full description of the Alpha keyboard and placement of the various symbols.

In USER mode, when referring to the top two rows of keys (the keys having been redefined), this manual will use the symbols **A** **J** and  **A**  **E** on the User Instruction Form and in the keystroke solutions to sample problems.

Units

All angular inputs in the Surveying Pac are accepted and output in Degrees. Minutes Seconds (D.MS) mode, unless otherwise noted. Lengths may be entered in any convenient unit, except for the programs ACRES, ENDVOL, and PIT where they must be in feet.

Using Optional Printer

When the optional printer is plugged into the HP-41C along with the Surveying Pac Applications Module, all results will be printed automatically.

You may also want to keep a permanent record of the values input to a certain program. A convenient way to do this is to set the Print Mode switch to NORMAL before running the program. In this mode, all input values and the corresponding keystrokes will be listed on the printer, thus providing a record of the entire operation of the program.

Using Programs As Subroutines

Some programs in the Surveying Pac may be called as subroutines for user programs in the HP-41C's program memory. Refer to appendix B for information regarding use of these subroutines.

Downloading Module Programs

If you wish to trace execution, to modify, to record on magnetic cards, or to print a program in this Application Module, it must first be copied into the HP-41C's program memory. For information concerning the HP-41C COPY function, see the Owner's Handbook. It is *not* necessary to copy a program in order to run it.

Program Interruption

These programs have been designed to operate properly when run from beginning to end, without turning the calculator off (remember, the calculator may turn itself off). If the HP-41C is turned off, it may be necessary to set flag 21 (SF 21) to continue proper execution.

Use of Labels

The user should be aware of possible problems when writing programs into calculator memory using Alpha labels identical with those in an Application Module. In order to avoid conflicts the user should take care to choose labels which are not *identical* with those in Application Modules.

Several labels used in the Surveying Application Module are also used in other modules. If you have this module and another plugged into your calculator, you should make sure that the module containing the program you want to use is in the lower numbered port.

You will find a list of all the global labels used in this application pac at the back of this manual in appendix D, Program Labels. The names of modules or accessories where duplicate labels occur are also listed. Before plugging in two or more modules, check that listing for duplicate label conflicts.

TRAVERSE, INVERSE AND SIDESHOTS

	INV N [†] E	AZ	DEF \angle	SLOPE D	CURVE
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	BEG N,E	BRG	FIELD \angle	HORIZ D	CLOSURE
TRAV	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
			BACK AZ	TRAVERSE	SIDESHOT
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

This program is designed for reducing field data and solving some of the commonly encountered field traversing problems. Four major routines are provided: 1) Bearing/Azimuth Traverse, 2) Field Angle Traverse, 3) Inverse and 4) Sideshots. These routines can be used separately, or it is easy to switch from one to another as required. Two additional routines are included to supplement the major routines: 5) Closure for Traverses and 6) Curved Sides for Traverses. Each of these routines is described with separate user instructions.

Upon beginning the program the user chooses the desired angular output (azimuths or bearings) and whether or not latitudes and departures for each leg will be displayed (default mode displays azimuths and does not display latitudes and departures).

The user may switch from bearing/azimuth data to field angle data at will, simply by using the proper input keys for the type of angle (see the user instructions and the keyboard overlay).

Sideshots may be made at anytime by changing to sideshot mode.

Bearing/Azimuth Traverse

This routine uses quadrant bearings or azimuths and horizontal distances to compute the coordinates of successive points in a traverse. The routines for Slope Distance Reduction and Curved Sides for Traverses can be used where slope distances or curves are encountered. At the end of the traverse, Closure for Traverses can be used to get the total distance traversed, area, and error of closure. Angle conventions for azimuths and quadrant bearings are shown below:

Field Angle Traverse

This routine uses horizontal distances and angles or deflections turned from a reference azimuth to compute the coordinates of successive points in a traverse. The routines for Slope Distance Reduction and Curved Sides for Traverses can be used where slope distances or curves are encountered. At the end of the traverse, Closure for Traverses can be used to get the total distance traversed, area, and error of closure. Angle conventions are shown below:

12 Traverse, Inverse and Sideshots

A reference azimuth toward or a back azimuth away from the point of beginning or a reference bearing toward the point of beginning must be input. Back azimuths are converted and displayed as azimuths toward the point. When switching from bearing/azimuths to field angles, the bearing or azimuth input of the last leg becomes the reference direction from which the field angles are turned.

Slope Distance Reduction

This routine calculates the horizontal distance, given the slope distance and a vertical angle or zenith angle. Vertical angles must be less than 45° and zenith angles must be greater than 45° .

Inverse

This routine calculates the distance and direction of the line joining two points, given the coordinates of the points. A figure may be traversed by entering the coordinates of successive points, as in the example. The routine, Curved Sides for Traverses, may be used where curves are encountered. At the end of a traverse, Closure for Traverses can be used to get the total distance traversed and area. Note that you may employ the inverse routine at any time during a traverse by going to step 5 of these User Instructions.

				SIZE: 016

Sideshots

This routine is used to make sideshots or radials from a point. Any of the three methods described under Traverses may be used for a sideshot: 1) input a field angle turned from a reference azimuth and a distance and calculate the coordinates of the point, 2) input a bearing (or azimuth) and a distance and calculate the coordinate of a point, 3) input the coordinates of a point and calculate the distance and azimuth of the line to the point. The Slope Distance Reduction routine may be used where slope distances are encountered.

This routine may be used in conjunction with a traverse or as a stand-alone routine. When used with a traverse one may switch back and forth at will. Stored data is used by either, but not destroyed so long as a new occupied point is not input, and the traverse operation may be continued from the occupied point.

As with a traverse, the user may use either bearing/azimuth or field angle inputs at will.

				SIZE: 016

Closure for Traverses

This routine is designed to be used at the completion of a Field Angle Traverse, Bearing/Azimuth Traverse, or Inverse. From the correct closing coordinates, the following are calculated: total distanced traversed (ΣHD), area, closure azimuth, and closure distance. The traverse can be closed exactly by inverting from the last point calculated to the correct closing coordinates.

24 Traverse, Inverse and Sideshots

				SIZE: 016
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	At completion of a closed traverse, initiate closure routine. Display the sum of the total distance traversed, (ΣHD), and the area.*		E R/S †	$\Sigma HD =$ AREA =
2	Input the correct closing coordinates and calculate the error azimuth and distance.	N CORR E CORR	R/S † R/S R/S R/S † R/S † R/S † R/S †	N CORR=? E CORR=? CLOSURE AZ=(or brg.) HD=(closing HD) N#= E# =
3	(optional) To include the error course in the traverse and adjust the area: inverse to the correct closing coordinates.	N CORR E CORR	ENTER* A R/S † R/S † R/S †	AZ=(or brg.) HD= N#= E# =
4	(optional) Go to step 1 to recalculate the ΣHD and area. NOTE: Steps 3 and 4 are optional. Step 3 may be performed before steps 1 and 2 and step 4 may then be omitted. * The area will be displayed in square units of the distance, i.e., feet ² if HD is in feet, meters ² if HD is in meters, etc.			
5	For area in acres: (Use only if distances were entered in feet.)		XEQ ACRES	AREA=(acres)

† This **R/S** not necessary when calculator is operated with a printer.

Example:

Rework the bearing traverse example and perform closure.

Keystrokes:

The last coordinates calculated were:

E

R/S

R/S

100 **R/S**

500 **R/S**

R/S

R/S

R/S

R/S

Display:

E7=500.0000

$\Sigma HD=390.1078$

AREA=8,855.4660

The adjusted area is only about 0.025 square feet different.

To obtain the final area in acres:

XEQ ALPHA ACRES ALPHA

AREA=0.2033

Curved Sides for Traverses

This routine is designed to be used with the Traverse or Inverse routines to include circular curved sides.

Traverse to the beginning point of the curve (PC) and input the bearing (or azimuth) or field angle to the end point of the curve. Then begin the Curved Sides routine and input the central angle and radius. The Curved Sides routine calculates the segment area and arc length for use in the Closure for Traverses routine to calculate distance traversed and area.

To include a curved side when inversing, inverse to the PC, execute the Curved Sides routine and then continue the inverse to the point at the end of the curve, (PT).

If the central angle and radius of the curve are not known they may be calculated from the other curve parameters using the Curve Solutions program *before beginning* the traverse.

				SIZE: 016
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	Traverse to the point at which the curve begins (PC). (Follow Traverse Instructions, steps 1 through 11, or instructions for inverse.)			
2	Input the azimuth, bearing or field angle to the next point of the traverse. (See steps 5 or 7 of Traverse Instructions.)			AZ=(or brg.)
3	Initiate the curved sides routine and input the central angle, (Δ), and the radius. (Positive if the segment area is to be added to the traverse, negative if the segment area is to be subtracted from the traverse.) The segment area will be displayed.	Δ (D.MS) R	E R/S R/S	DELTA=? R=? SEG=
4	Calculate the arc length (L) the tangent (T) and the chord (C).		R/S† R/S† R/S†	L= T= C=
5	Press to use the chord as the horizontal distance to the next point of the traverse and calculate coordinates of the next point. OR,		 R/S† R/S†	HD=(chord) N#= E# =
5a	If inversing, input coordinates of PT.	N(PT) E(PT)	ENTER+ A	(inverse outputs)
6	Continue the traverse.			

† This not necessary when calculator is operated with printer.

Curved Sides for Traverses

The purchase of a piece of property is being considered, but there is some question as to the exact size as it is bordered by a road on one end. The sketch above shows a rough survey, what is the correct area?

Notes

COMPASS RULE ADJUSTMENT

This program adjusts a traverse using the compass or Bowditch rule. The data to be adjusted consists of the coordinates of the points for each leg of the traverse.

If the *Traverse* program has just been run, and step 3 of the Closure for Traverses *has not* been executed, the storage registers will be set to start the adjustment. Otherwise, the total horizontal distance traversed and the calculated coordinates of the last point as well as the beginning coordinates must be input. Then for each pair of coordinates, the adjusted values can be calculated.

The Inverse routine of the *Traverse* program may be used to obtain bearings, distances and area from the adjusted coordinates.

Note:

Coordinates must be entered in the same sequence as originally traversed, starting at the second point.

				SIZE 016

TRANSIT RULE ADJUSTMENT

This program adjusts a traverse by the transit rule method. The data to be adjusted consists of the coordinates of the points for each leg of the traverse.

If the *Traverse* program has just been run, and step 3 of the Closure for Traverses *has not* been executed, the storage registers will be set to start the adjustment.

Otherwise the calculated coordinates of the last point and the beginning coordinates must be input. In addition the user must then enter all the un-adjusted coordinates of the traverse to calculate the adjustment data.

The Inverse routine of the *Traverse* program may be used to obtain bearings, distances and area from the adjusted coordinates.

Note:

Coordinates must be entered in the same sequence as originally traversed, starting at the second point.

				SIZE: 016

Notes

INTERSECTIONS

This program calculates information for the point of intersection of two lines. Given the coordinates of two points the required information is:

- A. For a bearing-bearing intersection: the bearings (or azimuths) of the lines through the points.
- B. For a bearing-distance intersection: the bearing from one point and the distance from the second point.
- C. For a distance-distance intersection: the distances from each of the points.
- D. For offsets from a point to a line: the bearing from the base point to the intersection.

Two solutions are possible for bearing-distance and distance-distance intersections and both solutions are calculated.

Calculated data includes the bearing and distance from each point to the intersection and the coordinate of the point of intersection. In addition, the bearing and distance from the first to the second point may be displayed, if desired.

This program is designed to calculate parameters for circular curves. Two parameters must be known, either 1) both radius (degree of curve) and central angle, or 2) one of the above plus one of the following: arc length, chord, tangent, mid ordinate or external. All eight parameters can be calculated, as well as the areas of the fillet, segment and sector.

M = Mid Ordinate
 E = External
 R = Radius
 D = Degree of Curve (arc definition)
 Δ = Central Angle (Delta)
 L = Arc Length
 T = Tangent
 C = Chord

In normal operational mode the program accepts D (the degree of curve) by arc definition. An optional mode allows setting of program to accept D by chord definition.

				SIZE: 005

HORIZONTAL CURVE LAYOUT

	RESTART → LTCME → AREAS			D-CHD	
CURVE, HORIZ, VERT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
		STA	ELEV	INTERVAL	STA ₀ /EL ₀
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

This program calculates the field data for layout of a horizontal circular curve by one of four methods: 1) PC deflections and chord lengths, 2) PI deflections and distances, 3) tangent distances and offsets, and 4) chord distances and offsets. The required information on the curve is the PC or PI station, radius or degree of curve, and central angle. Field data for any specified station can be calculated or, if a stationing interval is given, the field data for successive stations can be calculated automatically.

The *Curve Solutions* program is used to calculate and input the necessary parameters for this program. It may also be used to calculate the other curve parameters after this program has been run.

Field data output for PC deflections consist of:

STA—current station

ANG—deflection angle from tangent to long chord

LC—long chord from PC to current station

SC—short chord from previous station to current station

Δ —central angle

PI—point of intersection of tangents

PC, PT—ends of curve

PI Deflections:

Field data output for PI deflections consists of:

STA—current station

ANG—deflection angle from tangent to line joining PI and current station

DIST—distance from PI to current station

Tangent Offsets:

Field data output for tangent offsets consists of:

STA—current station

TD—tangent distance

TO—tangent offset

T—distance from PC to PI

Chord Offsets:

Field data output for chord offsets consists of:

STA—current station

CD—chord distance

CO—chord offset

L—length of curve from PC to PT.

		STA	ELEV	INTERVAL	STA ₀ /EL ₀
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

This program calculates station and elevation data for vertical curves* and straight grades. The required information for a vertical curve is the beginning station (or station at intersection of tangents), elevation, beginning grade, ending grade and one of the following: 1) length of the curve, 2) elevation at high or low point, or 3) station and elevation through which the curve passes. Required information for a straight grade is beginning station, elevation and grade. Stations at specified elevations can be calculated as well as elevations at specified stations. If a stationing interval is given, elevations at successive stations are calculated automatically.

* This program is based on an equal tangent parabolic vertical curve.

				SIZE: 014

RESECTION

This program is designed to solve the "three point problem," or resection, which is a method of locating a point from three known points. Required information is the distances between points 1 and 2 and points 2 and 3, and the angle C. Alternatively, the coordinates of the three points may be used. The angles A and B must also be known. The points must be arranged in clockwise order as 1, 2, 3, P. The angles D and E are calculated and the five distances between the points can also be calculated. If coordinates for the three points were input, coordinates of point P can also be obtained.

There are three possible cases depending on the spatial relationship of the points.

Case 1

Point P is outside the triangle formed by points 1, 2 and 3 and opposite point 2.

Case 2

Point P is within the triangle formed by points 1, 2 and 3.

Case 3

Point P is outside the triangle formed by points 1, 2 and 3 and on the same side as point 2.

Note:

Be sure that the points are arranged 1, 2, 3, P in clockwise order for all three cases.

				SIZE: 016
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY

PREDETERMINED AREA

This program is designed to solve two cases for specifying the area of a land parcel, 1) by hinging one side of a triangle, and 2) by sliding one side of a trapezoid perpendicular to another.

Line Through a Point (Triangular Parcel)

The area of the land parcel must be divided so that a triangle of desired area can be solved by hinging one side.

The required information consists of the coordinates of points 1 and 2 and the bearing (azimuth) of the line from point 2 toward point 3. Alternatively, the distance between points 1 and 2 and the angle at point 2 can be given. The program outputs the angles at points 1 and 2 and the distances from points 1 and 2 to point 3. If coordinates for points 1 and 2 were given, the coordinates for point 3 are also output.

Two Sides Parallel (Trapezoidal Parcel)

The area of a land parcel must be divided so that a trapezoid of desired area can be solved by sliding one of the parallel sides.

The required information consists of the coordinates of points 1 and 2 and the bearings (azimuths) of the lines 1-3 and 2-4. Alternatively, the distance between points 1 and 2 and the angles at points 1 and 2 can be given. The program outputs the angles at points 1 and 2 and the distances between points 1 and 3, points 2 and 4 and points 3 and 4. If coordinates for points 1 and 2 are given, coordinates for points 3 and 4 are also output.

Notes

VOLUME BY AVERAGE END AREA

This program calculates volumes of earth by the method of average end area. The required information is the elevation and offset or horizontal distance for each point on the cross-section and the interval between cross-sections.

The volume for each section is calculated, as well as the total accumulated volume. The cross-section area is also calculated.

The cross-sections must either be all cut or all fill. The user may choose to have volumes output in cubic yards or cubic feet, all areas are in square feet.

You may start at any point on the cross-section and the elevations and distances may be measured from any base lines as long as the same lines are used for the whole section. In addition, you may work around the section clockwise (CW) or counterclockwise (CCW).

Note:

Execution of this program clears all storage registers.

				SIZE: 014
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY

Notes

VOLUME OF A BORROW PIT

The volume of a borrow pit may be calculated with this program. The required information is the width and length of a rectangular section or base and height of a triangular section and the elevation at each corner of the section.

The volume of each section is calculated, as well as the total accumulated volume. You may choose to have volumes calculated in cubic yards or cubic feet.

Note:

Execution of this program clears all storage registers.

				SIZE: 014
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	Begin Borrow Pit program		[XEQ] PIT	CU YDS?
2	If you wish volumes displayed in cubic yards: or, if you wish volumes displayed in cubic feet:	Y	[R/S]	CU YDS

The volumes of the remaining sections are computed in a similar manner. The final total volume will be 10,457.88 cubic feet.

Notes

COORDINATE TRANSFORMATION

This program translates, rotates and rescales coordinates. Required data are the rotation angle and a pivot point in the old and new coordinate systems. The rotation angle is entered as a negative value for clockwise rotation or as a positive value for counterclockwise rotation. If a new scale factor (other than unity) is desired, it may be entered.

Alternatively, if the coordinates of two points are known in both systems the transformation parameters may be automatically calculated and the coordinate transformation performed.

				SIZE: 014
STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
1	Begin Coordinate Transformation program. Then go to step 2 or step 6. If rotation angle is known:		<input type="button" value="XEQ"/> COORD	ROT. Δ=?

FORMULAS AND REFERENCES

General References:

1. Surveying, Theory and Practice, Fifth Edition, Raymond E. Davis, Francis S. Foote, Joe W. Kelly, McGraw Hill Book Company, New York, 1966.
2. Surveying, Sixth Edition, Francis H. Moffitt and Harry Bouchard, Intext Educational Publishers, New York, 1975.

Traverse, Inverse and Sideshots

1. $HD = SD \sin (\text{zenith angle})$
2. $HD = SD \cos (\text{vertical angle})$
3. $\text{Latitude}_k = LAT_k = N_{k+1} - N_k$
For instance: $LAT_1 = N_2 - N_1$
4. $\text{Departure}_k = DEP_k = E_{k+1} - E_k$
For instance: $DEP_4 = E_5 - E_4$
5.
$$\text{Area} = \sum_{k=1}^n LAT_k \left(\frac{1}{2} DEP_k + \sum_{j=1}^{k-1} DEP_j \right)$$

In evaluating equation 6, j assumes all values from 1 to k for each value of k , before k takes on the next higher value. For instance, for $k = 3$, the sum of departures 1 and 2 is added to $\frac{1}{2}$ of departure 3, and the result is multiplied by latitude 3.

For $n = 3$, the three terms of equation 6 (for $k = 1, 2$ and 3) are =

$$k = 1: LAT_1 \left(\frac{1}{2} DEP_1 \right)$$

$$k = 2: LAT_2 \left(\frac{1}{2} DEP_2 + DEP_1 \right)$$

$$k = 3: LAT_3 \left(\frac{1}{2} DEP_3 + DEP_1 + DEP_2 \right)$$

For $n = 3$, the area is the sum of these three terms.

$$6. \text{ Segment area} = \frac{R^2}{2} \left(\frac{\Delta\pi}{180} - \sin \Delta \right)$$

$$7. \text{ Arc length: } L = \frac{R\Delta\pi}{180}$$

$$8. \text{ Tangent: } T = R \tan \left(\frac{\Delta}{2} \right)$$

$$9. \text{ Chord: } C = 2 R \sin \left(\frac{\Delta}{2} \right)$$

where:

INT = Integer portion of number (portion to left of decimal point).

QD = Quadrant.

BRG = Bearing.

HD = Horizontal distance.

SD = Slope distance.

n = Number of points in survey.

R = Radius of curve of segment boundary.

Δ = Central angle of curve of segment boundary.

Compass Rule

See reference 1, pp 458-463.

Compass Rule for latitude and departure course correction:

$$1. \text{ Corrected latitude}_1 = L_1 + d_1 = L_1 + \frac{(HD)_1(ER L)}{\Sigma(HD)}$$

$$2. \text{ Corrected departure}_1 = D_1 + d_1 = D_1 + \frac{(HD)_1(ER D)}{\Sigma(HD)}$$

Transit Rule

Transit Rule for latitude and departure course correction:

$$3. \text{ Corrected latitude} = L_1 + d_1 = L_1 + \frac{(ER L)(|L|)}{\Sigma|L|}$$

$$4. \text{ Corrected departure} = D_1 + d_1 = D_1 + \frac{(ER D)(|D|)}{\Sigma|D|}$$

88 Formulas and References

where: (for both Compass and Transit Rules:)

L_1 = Uncorrected latitude of any course

D_1 = Uncorrected departure of any course

ER L = Total error in latitude (closing latitude)

ER D = Total error in departure (closing departure)

HD = Uncorrected horizontal distance of any course

l_1 = Correction to be applied to the uncorrected latitude of the course

d_1 = Correction to be applied to the uncorrected departure of the course

Intersections

For any plane triangle with sides and angles as shown, the following relationships exist:

$$1. \frac{D2}{\sin \alpha} = \frac{D12}{\sin \phi} = \frac{D1}{\sin \theta}$$

$$2. D2^2 = D12^2 + D1^2 - 2 (D12) (D1) \cos \alpha$$

Representative equations for solving the four intersection problems:

$$3. D12 = \sqrt{(N_2 - N_1)^2 + (E_2 - E_1)^2}$$

$$4. \sin AZ13 = \frac{E3 - E1}{D1}$$

$$5. \cos AZ13 = \frac{N3 - N1}{D1}$$

$$6. \sin \text{BRG23} = \frac{E2 - E3}{D2}$$

$$7. \cos \text{BRG23} = \frac{N2 - N3}{D2}$$

For bearing-bearing case:

$$8. D1 = \frac{(D12) \sin \theta}{\sin \phi}$$

For bearing-distance case:

$$9. D1 = (D12) \cos \alpha \pm \sqrt{(D2)^2 - [(D12) \sin \alpha]^2}$$

For distance-distance case:

$$10. \text{Bearing } 13 = \text{bearing } 12 \pm \alpha$$

$$11. \cos \alpha = \frac{(D12)^2 + (D1)^2 - (D2)^2}{2(D12)(D1)} \quad (\text{law of cosines})$$

For offset from a point to a line:

$$12. D2 = (D12) \sin \alpha, \text{ then use 9.}$$

Curve Solutions

$$1. \frac{\Delta}{2} = \tan^{-1} \left(\frac{T}{R} \right) = \sin^{-1} \left(\frac{C}{2R} \right) = \frac{90L}{\pi R}$$

$$2. D = \frac{18000}{R\pi} \quad (\text{by arc definition}), \text{ or,}$$

$$D = 2 \sin^{-1} \frac{50}{R} \quad (\text{by chord definition})$$

$$3. L = \frac{\pi R \Delta}{180}$$

$$4. C = 2 R \sin \left(\frac{\Delta}{2} \right) = 2 T \cos \left(\frac{\Delta}{2} \right)$$

$$5. T = R \tan \left(\frac{\Delta}{2} \right)$$

90 Formulas and References

6. $R = \frac{C}{2 \sin (\Delta/2)}$
7. $E = T \tan \left(\frac{\Delta}{4} \right)$
8. $M = R \left[1 - \cos \left(\frac{\Delta}{2} \right) \right]$
9. Sector area $= \frac{\pi R^2 \Delta}{360} = \frac{LR}{2}$
10. Segment area $= \text{Sector area} - \frac{1}{2} R^2 \sin \Delta$
 $= \text{Sector area} - \frac{1}{2} CR \cos \left(\frac{\Delta}{2} \right)$
11. Fillet area $= RT - \text{Sector area}$
where:
 - L = Arc length
 - R = Radius
 - D = Degree of curve
 - Δ = Central angle
 - C = Chord
 - T = Tangent
 - E = External
 - M = Mid ordinate

Horizontal Curve Layout

1. $L = \frac{\Delta \pi R}{180}$
2. Deflection angle $= \frac{\Delta}{2}$
3. Defl. ang. $= \frac{90L}{\pi R}$
4. Defl./ft. $= \frac{\text{defl. ang.}}{L}$
5. Ft./defl. $= \frac{L}{\text{defl. ang.}} = \frac{\pi R}{90}$

$$6. D = \frac{18,000}{\pi R} = \frac{200}{\text{ft./defl.}} \text{ (by arc definition), or,}$$

$$D = 2 \sin^{-1} \frac{50}{R} \text{ (by chord definition)}$$

$$7. LC = 2 R \sin (\text{defl. ang.})$$

$$8. TO = LC \sin (\text{defl. ang.})$$

$$9. TD = LC \cos (\text{defl. ang.})$$

$$10. \text{PI dist.} = \sqrt{(T - TD)^2 + TO^2}$$

$$11. \text{PI ang.} = \tan^{-1} \left(\frac{TO}{T - TD} \right)$$

$$12. CO = LC \sin \left(\frac{\Delta_c}{2} - \text{defl. ang.} \right)$$

$$13. CD = LC \cos \left(\frac{\Delta_c}{2} - \text{defl. ang.} \right)$$

where:

Note:

See figures in program description to clarify definitions.

L = Length of arc subtending central angle Δ and corresponding to long chord LC .

Δ = Central angle of arc L and of long chord LC .

R = Radius.

Deflection angle = Angle from long chord LC to tangent T .

D = Degree of Curve = Central angle, measured in degrees, subtending arc of 100 ft. (by arc definition) or chord of 100 ft. (by chord definition).

LC = Long chord between PC and station on curve.

TO = Tangent offset = Perpendicular from tangent to station on curve.

TD = Tangent distance = Distance along tangent from PC to right angle intersection of tangent and tangent offset.

PI dist. = Distance from PI to station on curve.

T = Distance from PC to PI .

PI ang. = Angle between tangent and line between PI and station.

CO = Perpendicular distance from chord PC - PT to station on curve.

92 Formulas and References

Δ_c = Central angle of curve = Angle subtended by curve PC-PT and by chord PC-PT.

CD = distance along chord PC-PT from PC to intersection with CO.

Vertical Curves and Grades

Grades:

$$1. \quad EL = (STA - STA1) \frac{G1}{100} + EL1$$

where:

EL = Elevation at station STA.

STA = Station with elevation EL.

STA1 = Beginning station.

G1 = Grade (in percent).

EL1 = Beginning elevation.

Vertical Curves:

Length and beginning station (L and PC) known:

$$2. \quad \left(\frac{G_n - G_1}{200L} \right) (STA - PC)^2 + \left(\frac{G_1}{100} \right) (STA - PC) + (EL_1 - EL) = 0 \quad (ax^2 + bx + c = 0)$$

Length and intersection of tangents station (L and PI) known:

$$3. \quad PC = PI - \frac{L}{2} \quad (\text{Substitute in eq. 2})$$

High or low point elevation and beginning station (EL_0 and PC) known:

$$4. \quad L = 200(EL_1 - EL_0)(G_n - G_1) \left(\frac{1}{G_1^2} \right)$$

High or low point elevation and point of tangent intersection (EL_0 and PI) known:

$$5. \quad L = 200(EL_1 - EL_0)(G_n - G_1) \left(\frac{1}{G_n G_1} \right)$$

Curve to pass through specified point:

PC known:

$$6. \quad L = \left[\frac{(STA - PC)^2}{\frac{G1}{100} (STA - PC) - (EL - EL1)} \right] \left[\frac{200}{G1 - Gn} \right]$$

PI known:

$$7. \quad \left(\frac{1}{4} \right) L^2 + \left[(STA - PI) - \frac{200}{G1 - Gn} \left\{ \frac{G1}{100} (STA - PI) - (EL - EL1) \right\} \right] L + (STA - PI)^2 = 0 \quad (aL^2 + bL + c = 0)$$

$$8. \quad EL1 = ELI - \left(\frac{G1}{100} \right) \left(\frac{L}{2} \right)$$

Roots of quadratic equation $ax^2 + bx + c = 0$:

$$9. \quad x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

where:

Gn = Ending grade (in percent).

$G1$ = Beginning grade (in percent).

L = Length of curve measured along horizontal.

STA = Station along horizontal with curve elevation EL .

PC = Beginning station (point of curve).

$EL1$ = Beginning elevation.

EL = Elevation of curve at station STA .

$ax^2 + bx + c$ = General form of quadratic equation.

PI = Station of tangent intersection point (intersection of lines tangent to curve at beginning and ending of curve).

EL_0 = Elevation of high or low power of curve.

ELI = Elevation of curve at station PI .

Resection

$$1. \frac{\sin a}{A} = \frac{\sin b}{B} = \frac{\sin c}{C} \text{ (law of sines)}$$

$$2. K = \frac{L2 \sin A}{L1 \sin B}$$

$$3. A + B + C + D + E = 360^\circ$$

$$4. \tan \theta_1 = \frac{E2 - E1}{N2 - N1}$$

$$5. \tan \theta_2 = \frac{E3 - E2}{N3 - N2}$$

$$6. \tan \left(\frac{D - E}{2} \right) = \frac{\left[\frac{L2 \sin A}{L1 \sin B} - 1 \right] \tan \left(\frac{D + E}{2} \right)}{\frac{L2 \sin A}{L1 \sin B} + 1}$$

where:

A, B, C = Sides of any plane triangle.

a, b, c = Opposite angles.

K = Expression used in comments associated with program listing.

A, B, C, D, E = The 5 angles shown in resection diagrams in program description.

θ_1, θ_2 = Auxiliary angles used in resection solution.

$N_1, E_1, N_2, E_2, N_3, E_3$ = Coordinates of 3 points in resection diagram.

L1 = Distance between points 1 and 2 in resection diagram.

L2 = Distance between points 2 and 3 in resection diagram.

Predetermined Area**Line Through a Point**

$$1. \text{Area} = \frac{h}{2} (\text{HD})$$

$$2. h = (D2) \sin (\text{ANG } 2)$$

$$3. \text{ Area} = \left(\frac{\text{HD}}{2} \right) (\text{D2}) \sin (\text{ANG } 2)$$

$$4. \text{ D2} = \frac{2 (\text{area})}{(\text{HD}) \sin (\text{ANG } 2)}$$

$$5. \text{ N}_3 = \text{N}_2 + (\text{D2}) \cos (\text{AZ})$$

$$6. \text{ E}_3 = \text{E}_2 + (\text{D2}) \sin (\text{AZ})$$

where:

h = Height of triangle.

HD = Horizontal distance between points 2 and 1.

D2 = Distance between points 2 and 3.

ANG 2 = Angle at point 2 between lines 2-1 and 2-3.

N₃, E₃ = Coordinates of point 3.

N₂, E₂ = Coordinates of point 2.

AZ = Azimuth of line 2-3.

Two Sides Parallel

$$7. \text{ D3} = \sqrt{(\text{HD})^2 - 2\text{A}[\cot(\text{ANG1}) + \cot(\text{ANG2})]}$$

$$8. \text{ h} = 2\text{A}/(\text{HD} + \text{D3})$$

$$9. \text{ D1} = \frac{\text{h}}{\sin(\text{ANG } 1)}$$

$$10. \text{ D2} = \frac{\text{h}}{\sin (\text{ANG } 2)}$$

where:

A = Area of trapezoid.

h = Altitude of trapezoid.

HD = Horizontal distance of fixed base of trapezoid (side 1-2).

D3 = Distance between points 3 and 4 (length of movable base).

ANG 1 = Internal angle at point 1, between sides 1-2 and 1-3.

ANG 2 = Internal angle at point 2, between sides 2-1 and 2-4.

HD = Horizontal distance of fixed base of trapezoid (side 1-2).

D3 = Distance between points 3 and 4 (length of movable base).

ANG 1 = Internal angle at point 1, between sides 1-2 and 1-3.

ANG 2 = Internal angle at point 2, between sides 2-1 and 2-4.

Volume by Average End Area

$$1. \text{ VOL} = (\text{AREA}_i + \text{AREA}_{i-1}) \frac{\text{INT}}{2}$$

$$2. \text{ AREA} = \frac{1}{2} [\text{EL}_1(\text{D}_2 - \text{D}_n) + \dots + \text{EL}_n(\text{D}_1 - \text{D}_{n-1})]$$

Where:

VOL = Average volume between two stations.

AREA = Cross sectional area at a station.

INT = Interval between stations.

EL = Elevation at a point on a cross section.

D = Horizontal distance (offset) from centerline at cross section.

i = Subscript referring to current point or station.

n = Subscript referring to last point or station.

numeric subscript: refers to point or station number.

Volume of a Borrow Pit

$$1. \text{ VOL}_\Delta = \frac{\text{BH}}{2} (\text{EL})$$

$$2. \text{ VOL}_\square = \text{WL} (\text{EL})$$

where:

VOL_Δ = Volume of triangular grid section.

B = Base of triangle.

H = Height of triangle.

EL = Elevation of grid section or depth of cut (average depth of vertices).

VOL_\square = Volume of rectangular grid section.

W = Width of rectangle.

L = Length of rectangle.

Coordinate Transformation

$$AZ_R = \phi + \tan^{-1} \frac{E_I - E_p}{N_I - N_p}$$

$$HD_S = S \sqrt{(N_I - N_p)^2 + (E_I - E_p)^2}$$

$$N = N_p + H \text{ Dist}_s \cos (AZ_R) + T_N$$

$$E = E_p + H \text{ Dist}_s \sin (AZ_R) + T_E$$

$$T_N = N_{T_1} - E_p$$

$$T_E = E_{T_1} - E_p$$

where:

AZ_R = Rotated azimuth.

ϕ = Rotation angle.

N_I, E_I = Northing, easting of current point before transformation.

N_p, E_p = Original northing, easting of pivot point.

HD_S = Scaled horizontal distance.

S = Scale factor.

N, E = Northing, easting after transformation.

N_{T_1}, E_{T_1} = Northing, easting of pivot point after transformation.

Bearing—Azimuth Conversions

$$1. \text{ Azimuth} = 180 \left[\text{INT} \frac{QD}{2} \right] - \text{BRG} \cos [(180)(QD)]$$

$$2. \text{ Bearing} = |\sin^{-1} (\sin AZ)|$$

$$3. \text{ Quadrant code} = \text{INT} \left(\frac{AZ}{90} + 1 \right)$$
