Sales and service from 172 offices in 65 countries.  
19310 Pruneridge Avenue, Cupertino, CA 95014

SEPTEMBER, 1974

## INTRODUCTION

Programs for your HP-65 Surveying Pac I have been selected to provide solutions for many of the day-to-day problems you encounter.\*

In general, the programs are grouped into common problem areas of traversing, curves, triangles and intersections, field reductions, predetermined area and earthwork.

Included in Surveying Pac I are 34 prerecorded magnetic cards, a card case, 20 pocket instruction cards, and this instruction booklet with program descriptions, formulas, example problems, user instructions and program listings.

We are confident that you will find this pac useful, and we welcome any comments or suggestions you may have.

\*This pac is written using North American surveying conventions.

## FORMAT OF USER INSTRUCTIONS

The following is an example of a set of user instructions (from Field Angle Check – *Surveying 1-25A*):

| LINE | INSTRUCTIONS                       | DATA    | KEYS  | DISPLAY   |
|------|------------------------------------|---------|---|-----------|
| 1    | Enter program                      |         | <input type="text"/> <input type="text"/>       |           |
| 2    | Input Ref Az away from pt          | Ref Az  | <input type="text"/> A <input type="text"/>     |           |
| 3    | If angle right                     | Ang Rt  | <input type="text"/> B <input type="text"/>     |           |
| 4    | If angle left                      | Ang Lt  | <input type="text"/> CHS <input type="text"/> B |           |
| 5    | If deflection right                | Defl Rt | <input type="text"/> C <input type="text"/>     |           |
| 6    | If deflection left                 | Defl Lt | <input type="text"/> CHS <input type="text"/> C |           |
| 7    | Optional: Compute course brg       |         | <input type="text"/> D <input type="text"/>     | Brg       |
| 8    | Optional: Compute quad code        |         | <input type="text"/> R/S <input type="text"/>   | Quad      |
| 9    | Optional: Compute azimuth          |         | <input type="text"/> R/S <input type="text"/>   | Az        |
|      | (Repeat lines 3-9 for each course) |         | <input type="text"/> <input type="text"/>       |           |
| 10   | Compute angular error              |         | <input type="text"/> E <input type="text"/>     | Ang Error |
| 11   |                                    |         | <input type="text"/> R/S <input type="text"/>   | Ang Corr  |

If checking traverse between two points, the closing reference azimuth is entered via key A; angular error is then obtained at line 10.

To run another problem, press  $\square$   $\square$  then return to line 2.

The instructions read from left to right starting with line 1; follow any indicated operations in this order. Lines having no numbers contain special notes to the user and are in parentheses under the INSTRUCTIONS column. An example is the comment between lines 9 and 10.

Always move sequentially from line to line unless a comment in the INSTRUCTIONS column indicates otherwise. Thus, the comment after line 9, "Repeat lines 3-9 for each course", means to return to line 3 following the instructions indicated until all necessary data has been entered. If there were no more courses, the user would proceed to line 10 for further instructions.

Information under the DATA column will be the instruction to enter a number or value, even though in many cases there is not a comment given in the INSTRUCTIONS column.

Generally, where an instruction is designated as "Optional", the results have already been computed and stored. Thus, skipping optional path may save time by not displaying results but does not affect calculations.

The DISPLAY column indicates results where applicable. In some cases, the calculator display may show a value which is an intermediate factor used in final calculations and may be ignored.

The function keys A through E are used for entering data and displaying solutions. Keys to the left are used for data entry and those to the right for solutions. Solution keys are always indicated by "SOLN". Data is entered by entering the value and pressing the appropriate function key. Solutions are obtained by first pressing the appropriate function key and then, if the particular solution consists of multiple values, pressing the  $\square$  key successively until all the values have been displayed. The  $\square$  key is never used for data entry.

## POINTS TO REMEMBER

Turning the calculator off clears all storage registers, the operational stack, and program memory. Neither the storage registers nor the operational stack is disturbed when a program is loaded into the calculator.

When running successive problems with one program without turning the calculator off, clear the storage registers by pressing **f** **REG**. To insure that the program restarts execution properly, press **RTN** after **f** **REG**. The same rules apply when running one program after another unless data is utilized which was stored by a previous program. Failure to perform these steps may result in incorrect solutions.

When working with problems which involve the display of degrees, minutes, and seconds as output, set the decimal at four places (press **OSP** **▾** **4**) to enable full display of minutes and seconds.

Input degrees, minutes, seconds in the form DDD.MMSS, i.e., 60 degrees, 05 minutes and 12 seconds is displayed as 60.0512.

**CLX** may not be used as an equivalent to an input of zero.

Do not perform manual calculations between program execution steps. In many cases the stack contains values necessary for program execution.

Quadrant codes for bearings are as follows: NE is 1, SE is 2, SW is 3, and NW is 4.

## ENTERING A PROGRAM

From the card case supplied with this application pac, select a program card.

Set W/PRGM-RUN switch to RUN.

Turn the calculator ON. You should see 0.00

Gently insert the card (printed side up) in the right, lower slot as shown. When the card is part way in, the motor engages it and passes it out the left side of the calculator. Sometimes the motor engages but does not pull the card in. If this happens, push the card a little farther into the machine. Do not impede or force the card; let it move freely. (The display will flash if the card reads improperly. In this case, press **CLX** and reinsert the card.)

When the motor stops, remove the card from the left side of the calculator and insert it in the upper "window slot" on the right side of the calculator.

The program is now stored in the calculator. It remains stored until another program is entered or the calculator is turned off.

### FIELD ANGLE TRAVERSE

|                      |                |                  |                    |
|----------------------|----------------|------------------|--------------------|
| FIELD ANGLE TRAVERSE |                | SURV 1-01B       |                    |
| BEG N-E<br>-REF AZ   | ANGLE<br>LT-RT | DEFL<br>LT-RT    | DIST-<br>ZINTH ANG |
|                      |                | N-E-AREA<br>SOLN |                    |

This program will accept angles right, angles left, deflections right and deflections left as well as horizontal or slope distances. The coordinates of the next point are calculated, and area in square feet and acres are available upon completion of the traverse. Traversing between two known points is accomplished through a second program in which the coordinates of the closing point are entered. This same secondary program, Closure for Field Angle and Bearing Traverses (*Surveying 1-3A*), also computes area, closure for bearing and distance, total distance traversed and precision ratio.

Slope angles are assumed to be entered as zenith angles. To change the program to use vertical angles, the following sequence must be followed:

1. Enter program
2. Press **GTG** **D**
3. Switch to program mode (W/PRGM)-14 should appear in the display
4. Press **SST** (single step) three times-09 should appear in the display
5. Press **0** **DEL** (delete)-09 should appear in the display
7. Press **SST** eleven times-04 should appear in the display
7. Press **0** **DEL** -31 should appear in the display
8. Press **5** -05 should appear in the display
9. Record changed program by inserting blank card in reader
10. Switch back to run mode
11. Enter changed program and test

**Formulas used:**

$$\begin{aligned}
 H \text{ Dist} &= S \text{ Dist} \sin (Zn \text{th ang}) \\
 N_{i+1} &= N_i + H \text{ Dist} \cos Az \\
 E_{i+1} &= E_i + H \text{ Dist} \sin Az \\
 \text{Area} &= \frac{1}{2}[(N_2 + N_1)(E_2 - E_1) + (N_3 + N_2)(E_3 - E_2) + \dots + (N_n + N_1)(E_1 - E_n)]
 \end{aligned}$$

Where: N, E = Northing, easting of a point  
 Subscript i refers to current point  
 Subscript n refers to next to last point  
 Numeric subscript refers to point number  
 Az = Azimuth of a course  
 H Dist = Horizontal distance  
 S Dist = Slope distance  
 Znth ang = Zenith angle

Example:

Calculated Ending Coordinates N = 149.905  
E = 399.783

In this example, the Field Angle Traverse program is used until the calculated ending coordinates are established. The Closure for Field Angle and Bearing Traverse program is then loaded and the closing coordinates are entered (N = 150.00 and E = 400.00). From there, the remaining closure information can be obtained—see instructions for the Closure program (*Surveying 1-3A*).

Closure distance = 0.237  
Error bearing = S 66° 19' 43" W  
Distance traversed = 667.147  
Precision = 2814

NOTE: If registers for the Closure for Field Angle and Bearing Traverse program (*Surveying 1-3A*) have been manually loaded, variations in the above may occur due to rounding.

| LINE | INSTRUCTIONS  | DATA    | KEYS                                      | DISPLAY |
|------|---|---------|---|---------|
| 1    | Enter program   |         | <input type="text"/> <input type="text"/> |         |
| 2    |   | Begin N | A <input type="text"/>                    | Begin N |
| 3    |   | Begin E | A <input type="text"/>                    | Begin E |
| 4    | Input ref az away from pt   | Ref Az  | A <input type="text"/>                    |         |
| 5    | If angle right  | AR      | B <input type="text"/>                    |         |
| 6    | If angle left   | AL      | CHS B <input type="text"/>                |         |
| 7    | If deflection right   | DR      | C <input type="text"/>                    |         |
| 8    | If deflection left  | DL      | CHS C <input type="text"/>                |         |
| 9    | Input distance (SD or HD)   | Dist    | D <input type="text"/>                    |         |
| 10   | If horizontal distance  |         | D <input type="text"/>                    | H Dist  |
| 11   | If slope distance   | Zn Ang  | D <input type="text"/>                    | H Dist  |
| 12   | Compute Coords  |         | E <input type="text"/>                    | N       |
| 13   |   |         | R/S <input type="text"/>                  | E       |
|      | (Repeat lines 5-13 for successive courses. Lines 14 & 15 should be executed only after completion of polygon traverse.) |         | <input type="text"/> <input type="text"/> |         |
| 14   | Optional: Compute sq ft   |         | R/S <input type="text"/>                  | Sq Ft   |
| 15   | Optional: Compute acres   |         | R/S <input type="text"/>                  | Acres   |

For closure information and/or traverse between two points, proceed to program Closure for Field Angle & Bearing Traverse (*Surveying 1-3A*).  
To repeat field angle traverse go to line 2

## BEARING TRAVERSE

|                  |     |            |                   |
|------------------|-----|------------|-------------------|
| BEARING TRAVERSE |     | SURV 1-02A |                   |
| BEG N-E          | BRG | QUAD       | DIST-<br>ZNTN ANG |
| N-E-AREA<br>SOLN |     |            |                   |

This program uses bearings and horizontal or slope distances to calculate coordinates.

Traversing between two known points is accomplished through a second program in which the coordinates of the closing point are entered. This same secondary program, Closure for Field Angle and Bearing Traverse (*Surveying 1-3A*), also supplies area, closure bearing and distance, total distance traverses and precision ratio.

Slope angles are assumed to be entered as zenith angles. To change the program to use vertical angles, the following sequence must be followed:

1. Enter program
2. Press **GTO** **D**
3. Switch to program mode (W/PRGM)—14 should appear in the display
4. Press **SS1** (single step) three times—09 should appear in the display
5. Press **DEL** (delete)—09 should appear in the display
6. Press **SS1** 10 times—04 should appear in the display
7. Press **DEL**—31 should appear in the display
8. Press **5**—05 should appear in the display
9. Record changed program by inserting blank card in reader slot
10. Switch back to run mode
11. Enter changed program and test

### Formulas used:

$$H \text{ Dist} = S \text{ Dist} \sin (\text{Znth ang})$$

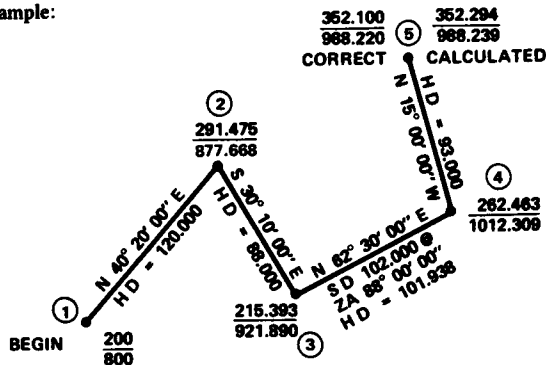

$$N_{i+1} = N_i + H \text{ Dist} \cos Az$$

$$E_{i+1} = E_i + H \text{ Dist} \sin Az$$

$$\text{Area} = \frac{1}{2}[(N_2 + N_1)(E_2 - E_1) + (N_3 + N_2)(E_3 - E_2) + \dots + (N_n + N_1)(E_n - E_1)]$$

Where: N, E = Northing, easting of a point  
 Subscript i refers to current point  
 Subscript n refers to next to last point  
 Numeric subscript refers to point number  
 Az = Azimuth of a course  
 H Dist = Horizontal distance  
 S Dist = Slope distance  
 Znth ang = Zenith angle

Example:

In this example, the Bearing Traverse program is used until the calculated ending coordinates are established. The Closure for Field Angle & Bearing Traverse program is then loaded and the closing coordinates are entered (N = 352.100 and E = 988.220). From there, the remaining closure information can be obtained -- see instructions for the Closure program (*Surveying 1-3A*).

$$\text{Closure distance} = 0.195$$

$$\text{Error bearing} = N 5^\circ 41' 31'' E$$

$$\text{Distance traversed} = 402.938$$

$$\text{Precision} = 2068$$

NOTE: If registers for the Closure for Field Angle and Bearing Traverse program (*Surveying 1-3A*) have been manually loaded, variations in the above may occur due to rounding.

Notes

| LINE | INSTRUCTIONS                      | DATA    | KEYS  | DISPLAY |
|------|-----------------------------------|---------|---|---------|
| 1    | Enter program                     |         | <input type="text"/> <input type="text"/>     |         |
| 2    |                                   | Begin N | <input type="text"/> A <input type="text"/>   | Begin N |
| 3    |                                   | Begin E | <input type="text"/> A <input type="text"/>   | Begin E |
| 4    | Input bearing                     | Brg     | <input type="text"/> B <input type="text"/>   |         |
| 5    | Input quadrant code               | Quad    | <input type="text"/> C <input type="text"/>   |         |
| 6    | Input distance (SD or HD)         | Dist    | <input type="text"/> D <input type="text"/>   |         |
| 7    | If horizontal distance            |         | <input type="text"/> D <input type="text"/>   | H Dist  |
| 8    | If slope distance                 | Zn Ang  | <input type="text"/> D <input type="text"/>   | H Dist  |
| 9    | Compute coords                    |         | <input type="text"/> E <input type="text"/>   | N       |
| 10   |                                   |         | <input type="text"/> R/S <input type="text"/> | E       |
|      | (Repeat lines 4-10 for successive |         | <input type="text"/> <input type="text"/>     |         |
|      | courses. Lines 11 & 12 should     |         | <input type="text"/> <input type="text"/>     |         |
|      | be executed only after comple-    |         | <input type="text"/> <input type="text"/>     |         |
|      | tion of polygon traverse.)        |         | <input type="text"/> <input type="text"/>     |         |
| 11   | Optional: Compute sq ft           |         | <input type="text"/> R/S <input type="text"/> | Sq Ft   |
| 12   | Optional: Compute acres           |         | <input type="text"/> R/S <input type="text"/> | Acres   |

For closure information and/or traverse between two points, proceed to program Closure for Field Angle & Bearing Traverse (Surveying 1-34).

To restart this program after an error or for new data press  then   and go to line 2.

## CLOSURE FOR FIELD ANGLE AND BEARING TRAVERSES

This program, used in conjunction with either the Field Angle Traverse program (*Surveying 1-1B*) or the Bearing Traverse program (*Surveying 1-2A*), computes area, closure bearing and distance, total distance traversed, and precision ratio.

Key **▲** is used only for entering the closing coordinates in the case of a traverse between two points (i.e., not a polygon).

If this program is not used immediately after the Field Angle Traverse program (*Surveying 1-1B*) or the Bearing Traverse program (*Surveying 1-2A*), or if the storage registers have been altered, or if the calculator power has been turned off since either of the traverse programs were run, enter the following data into the specified storage registers (this is done by entering the data in the display and pressing **STO**) followed by the register number for each of the five parameters):

| REGISTER | PARAMETERS TO BE STORED    |
|----------|----------------------------|
| 2        | Total distance traversed   |
| 4        | 2 X area (sq. ft.)         |
| 5        | Correct closing easting    |
| 6        | Correct closing northing   |
| 7        | Calculated ending easting  |
| 8        | Calculated ending northing |

### Formulas used:

$$\text{Closure distance} = \sqrt{(N_c - N_L)^2 + (E_c - E_L)^2}$$

$$\text{Precision ratio} = \frac{\Sigma \text{Dist}}{\text{Closure distance}}$$

$$\text{Error bearing} = \tan^{-1} \frac{E_c - E_L}{N_c - N_L}$$

Where:  $N_c, E_c$  = Correct closing northing and easting

$N_L, E_L$  = Calculated closing northing and easting

$\Sigma \text{Dist}$  = Total length of traverse

### Example:

Values stored in the registers given below are those stored by the Field Angle Traverse (*Surveying 1-1B*) example.

| REGISTER | VALUE                              |
|----------|------------------------------------|
| 2        | 667.147 Total distance traversed   |
| 4        | 53182.000 Area x 2 (sq ft)         |
| 5        | 400.000 Correct closing easting    |
| 6        | 150.000 Correct closing northing   |
| 7        | 399.783 Calculated ending easting  |
| 8        | 149.905 Calculated ending northing |

Using these values, the closure information is calculated.

Area = 26,591 sq ft = 0.610 Acres

Closure distance = 0.237 feet

Error bearing = S 66° 19' 43" W\*

Total distance traversed = 667.147 feet

Precision = 2814\*

\*These values will not be exact if values are stored manually. This is because of rounding of the input values.

| LINE | INSTRUCTIONS                                  | DATA    | KEYS   | DISPLAY  |
|------|---|---------|--|----------|
| 1    | Enter program                                 |         | <input type="text"/> <input type="text"/>            |          |
|      | (Skip lines 2-3 if registers loaded manually) |         | <input type="text"/> <input type="text"/>            |          |
| 2    | Input correct closing N                       | Close N | <input type="text"/> <b>A</b> <input type="text"/>   | Close N  |
| 3    | Input correct closing E                       | Close E | <input type="text"/> <b>A</b> <input type="text"/>   | Close E  |
| 4    | Optional: If polygon recall area              |         | <input type="text"/> <input type="text"/>            |          |
|      |   |         | <input type="text"/> <b>B</b> <input type="text"/>   | Sq Ft    |
| 5    | Optional                                      |         | <input type="text"/> <b>R/S</b> <input type="text"/> | Acres    |
| 6    | Compute closure dist                          |         | <input type="text"/> <b>C</b> <input type="text"/>   | Dist     |
| 7    | Compute error brg                             |         | <input type="text"/> <b>R/S</b> <input type="text"/> | Brg      |
| 8    | Compute quad code                             |         | <input type="text"/> <b>R/S</b> <input type="text"/> | Quad     |
| 9    | Compute total dist traversed                  |         | <input type="text"/> <b>D</b> <input type="text"/>   | Tot Dist |
| 10   | Compute precision ratio*                      |         | <input type="text"/> <b>E</b> <input type="text"/>   | Prcsn    |

\*Flashing zeros indicate perfect closure

### INVERSE FROM COORDINATES

|                          |          |            |                                     |  |
|--------------------------|----------|------------|-------------------------------------|--|
| INVERSE FROM COORDINATES |          | SURV 1-04A |                                     |  |
| BEG N-E                  | NEXT N-E | DIST SOLN  | BRG-QUAD AREA-TOT<br>SOLN DIST-SOLN |  |

This program uses coordinates to calculate distance and bearing between points of a traverse. The area in square feet and acres, plus a summation of distance inversed are also computed.

**Formulas used:**

$$H \text{ Dist} = \sqrt{(N_i - N_{i-1})^2 + (E_i - E_{i-1})^2}$$

$$Az = \tan^{-1} \frac{E_i - E_{i-1}}{N_i - N_{i-1}}$$

$$\text{Area} = \frac{1}{2} [(N_2 + N_1)(E_2 - E_1) + (N_3 + N_2)(E_3 - E_2) + \dots + (N_n + N_1)(E_1 - E_n)]$$

- Where:
- N, E = Northing, easting of a point
  - Subscript i refers to current point
  - Subscript n refers to next to last point
  - Numeric subscript refers to point number
  - H Dist = Horizontal distance
  - Az = Azimuth of a course

Example:

AREA = 20,938 SQ. FT.  
 0.481 ACRES  
 TOTAL DISTANCE INVERSED = 641.033

| LINE | INSTRUCTIONS                               | DATA   | KEYS  | DISPLAY  |
|------|--|--------|---|----------|
| 1    | Enter program                              |        | <input type="text"/> <input type="text"/>     |          |
| 2    |  | Beg N  | <input type="text"/> A <input type="text"/>   | Begin N  |

| 5    |  | Next E | <input type="text"/> B <input type="text"/>   | Dep.     |
| 6    | Compute distance                           |        | <input type="text"/> C <input type="text"/>   | Dist     |
| 7    | Compute bearing                            |        | <input type="text"/> D <input type="text"/>   | Brg      |
| 8    |  |        | <input type="text"/> R/S <input type="text"/> | Quad     |
|      | (Repeat lines 4-8 for successive courses.) |        | <input type="text"/> <input type="text"/>     |          |
| 9    | Optional: Compute area                     |        | <input type="text"/> E <input type="text"/>   | Sq. Ft.  |
| 10   | Optional:                                  |        | <input type="text"/> R/S <input type="text"/> | Acres    |
| 11   | Optional: total dist inversed              |        | <input type="text"/> R/S <input type="text"/> | Tot Dist |

To compute area correctly, lines 4-8 must be executed for each leg.  
 To repeat Inverse From Coordinates go to line 2.

## SIDESHOTS

| SIDE SHOTS          |                | SURV 1-05B    |                                     |
|---------------------|----------------|---------------|-------------------------------------|
| REF BRG-<br>OCC N-E | ANGLE<br>LT-RT | DEFL<br>LT-RT | DIST. SIDESHOT<br>ZNTN ANG N-E SOLN |

This program may be used alone or in conjunction with one of the traverse programs (*Surveying 1-1B*) or *Surveying 1-2A*). Used as a stand-alone program, the reference bearing from a backsight is entered along with the coordinates of the occupied point. If used with a traverse program, these steps are omitted and data stored by a traverse program is used. In either case, the stored data is not destroyed, and the traverse operation may be carried out from the point occupied.

Slope angles are assumed to be entered as zenith angles. To change the program to use vertical angles, the following sequence must be followed:

1. Enter program
2. Press **GTD** **D**
3. Switch to program mode (W/PRGM) - 14 should appear in the display
4. Press **SS** (single step) four times - 03 should appear in the display
5. Press **D** **DEL** (delete) - 44 should appear in the display
6. Press **SS** 15 times—04 should appear in the display
7. Press **D** **DEL**—31 should appear in the display
8. Press **S**—05 should appear in the display
9. Record changed program by inserting blank card in reader slot.
10. Switch back to run mode
11. Enter changed program and test

## Formulas used:

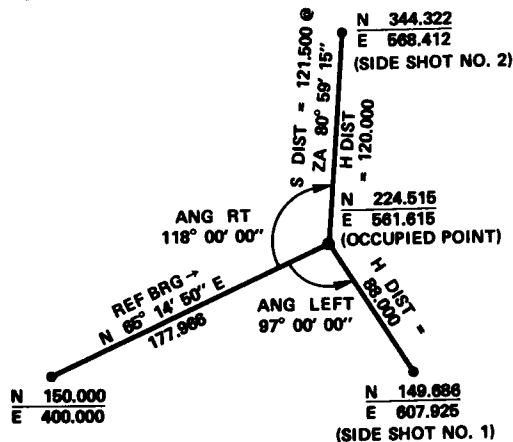

$$H \text{ Dist} = S \text{ Dist} \sin (\text{Znth ang})$$

$$N = N_1 + H \text{ Dist} \cos Az$$

$$E = E_1 + H \text{ Dist} \sin Az$$

Where:  $N, E$  = Northing, easting of sideshot  
 $N_1, E_1$  = Northing, easting of occupied point  
 $H \text{ Dist}$  = Horizontal distance  
 $S \text{ Dist}$  = Slope distance  
 $Znth \text{ ang}$  = Zenith angle  
 $Az$  = Azimuth to side shot

## Example:

Notes

| 11   | If horizontal distance            |         | <input type="text"/> D <input type="text"/>     | H Dist  |
| 12   | If slope distance                 | Zn Ang  | <input type="text"/> D <input type="text"/>     | H Dist  |
| 13   | Compute sideshot coordinates      |         | <input type="text"/> E <input type="text"/>     | N       |
|      |                                   |         | <input type="text"/> R/S <input type="text"/>   | E       |

To execute another side shot from the same point go to line 6, for a different point go to line 2.

## COORDINATE TRANSFORMATION

|                           |                   |                   |                      |
|---------------------------|-------------------|-------------------|----------------------|
| COORDINATE TRANSFORMATION |                   | <b>SURV 1-06A</b> |                      |
| OLD N-E<br>NEW N-E        | ROTATION<br>ANGLE | SCALE<br>FACTOR   | NEXT<br>N-E          |
|                           |                   |                   | TRNSFRMD<br>N-E SOLN |

This program translates, rotates, and rescales coordinates. Traverse rotation angle is entered as a positive value for counterclockwise rotation and negative for clockwise rotation. The translation factors are calculated by entering old and new grid system coordinates for the same point; rotation is also about this point.

**Formulas used:**

$$Az_R = \phi + \tan^{-1} \frac{E_I - E_P}{N_I - N_P}$$

$$H \text{ Dist}_S = S \sqrt{(N_I - N_P)^2 + (E_I - E_P)^2}$$

$$N = N_P + H \text{ Dist}_S \cos(Az_R) + T_N$$

$$E = E_P + H \text{ Dist}_S \sin(Az_R) + T_E$$

$$T_N = N_{T_1} - N_P$$

$$T_E = E_{T_1} - E_P$$

Where:

$Az_R$  = Rotated azimuth

$\phi$  = Rotation angle

$N_I, E_I$  = Northing, easting of current point before transformation

$N_P, E_P$  = Original northing, easting of pivot point

$H \text{ Dist}_S$  = Scaled horizontal distance

$S$  = Scale factor

$N, E$  = Northing, easting after transformation

$N_{T_1}, E_{T_1}$  = Northing, easting of pivot point after transformation

**Example:**

Coordinates before transformation are those computed by Compass Rule Adjustment (*Surveying 1-7A*).

Return to line 8 for next N,E. For new case start at line 2.

## COMPASS RULE ADJUSTMENT\*

|                         |            |               |               |   |
|-------------------------|------------|---------------|---------------|---|
| COMPASS RULE ADJUSTMENT |            |               |               | SURV 1-07A  |
| UNADJ<br>N              | UNADJ<br>E | ADJ N<br>SOLN | ADJ E<br>SOLN |  |

This program adjusts a traverse by the compass rule. It is intended to follow the program Closure For Field Angle and Bearing Traverses (*Surveying 1-3A*). However, if the correct coordinates of the last point, the computed coordinates of the last point, and the total distance traversed are known, these parameters can be used in lieu of executing the closure program.

If this program is not used immediately after Closure for Field Angle and Bearing Traverse (*Surveying 1-3A*) or the storage registers have been altered or the calculator turned off since the closure program was run, enter the following data into the specified storage registers. (This is done by entering the data in the display and pressing **STO** followed by the register number for each of the five parameters).

| REGISTER | PARAMETERS TO BE STORED    |
|----------|----------------------------|
| 2        | Total distance traversed   |
| 5        | Correct closing easting    |
| 6        | Correct closing northing   |
| 7        | Calculated ending easting  |
| 8        | Calculated ending northing |

The Inverse From Coordinates program (*Surveying 1-4A*) may be used to obtain adjusted bearings, distances and area.

\*This is also known as the Bowditch adjustment

To adjust a traverse between two points (non-polygon), run the Closure program (*Surveying 1-3A*) as usual. Then upon entering the Compass Rule Adjustment program:

Press **A**

Enter starting northing, press **STO** **2**, **STO** **6**

Enter starting easting, press **STO** **1**, **STO** **5**

Proceed to line 2 of the operating instructions.

Note: Coordinates must be reentered in the same sequence as originally traversed, starting at the second point.

Formulas used:

$$C_L = \frac{(\Delta N) (\text{Dist})}{\Sigma \text{Dist}}$$

$$C_D = \frac{(\Delta E) (\text{Dist})}{\Sigma \text{Dist}}$$

|        |                      |   |                                     |
|--------|----------------------|---|-------------------------------------|
| Where: | $C_L$                | = | Correction to latitude of a course  |
|        | $C_D$                | = | Correction to departure of a course |
|        | $\Delta N$           | = | Closing latitude                    |
|        | $\Delta E$           | = | Closing departure                   |
|        | Dist                 | = | Length of course to be corrected    |
|        | $\Sigma \text{Dist}$ | = | Total length of traverse            |

Example:

Values stored in the registers given below are those stored by the Field Angle Traverse (*Surveying 1-1B*) example.

| REGISTER | VALUE   |                            |
|----------|---------|----------------------------|
| 2        | 667.147 | Total distance traversed   |
| 5        | 400.000 | Correct closing easting    |
| 6        | 150.000 | Correct closing northing   |
| 7        | 399.783 | Calculated ending easting  |
| 8        | 149.905 | Calculated ending northing |

Using these values, the compass rule method of adjustment yields the following results:

| POINT NO.          | UNADJUSTED COORDINATES         | ADJUSTED COORDINATES           |
|--------------------|--------------------------------|--------------------------------|
| 2                  | $N = 224.515$<br>$E = 561.615$ | $N = 224.540$<br>$E = 561.673$ |
| 3                  | $N = 356.529$<br>$E = 468.600$ | $N = 356.577$<br>$E = 468.710$ |
| 4                  | $N = 232.337$<br>$E = 307.150$ | $N = 232.414$<br>$E = 307.327$ |
| Ending & Beginning | $N = 149.905$<br>$E = 399.783$ | $N = 150.000$<br>$E = 400.000$ |

| LINE | INSTRUCTIONS                 | DATA    | KEYS  | DISPLAY |
|------|------------------------------|---------|---|---------|
| 1    | Enter program                |         | <input type="text"/> <input type="text"/>   |         |
| 2    |                              | Unadj N | <input type="text"/> A <input type="text"/> |         |
| 3    |                              | Unadj E | <input type="text"/> B <input type="text"/> |         |
| 4    | Compute adjusted coordinates |         | <input type="text"/> C <input type="text"/> | Adj N   |
| 5    |                              |         | <input type="text"/> D <input type="text"/> | Adj E   |

Return to line 2 for next point.

## TRANSIT RULE ADJUSTMENT

|                         |         |         |            |              |
|-------------------------|---------|---------|------------|--------------|
| TRANSIT RULE ADJUSTMENT |         |         | SURV 1-08A |              |
| START                   | UNADJ N | UNADJ E | PRE-ADJUST | ADJ N-E SOLN |

This program adjusts a traverse by the transit rule method. It is intended to follow the program Closure for Field Angle or Bearing Traverses (*Surveying 1-3A*).

Because of storage register limitation and requirements of the transit rule method, it is necessary to enter the unadjusted coordinates twice.

If the storage registers have been altered in any way since one of the traverse programs or the closure program was run, store the following data in the specified registers (this is done by entering the data in the display and pressing **STO** followed by the register number for each of the parameters).

| REGISTER | PARAMETER TO BE STORED     |
|----------|----------------------------|
| 5        | Correct closing easting    |
| 6        | Correct closing northing   |
| 7        | Calculated ending easting  |
| 8        | Calculated ending northing |

The Inverse from Coordinates program (*Surveying 1-4A*) may be used to obtain bearings, distances and area from the adjusted coordinates. The starting and closing coordinates must be the same.

**NOTE:** Coordinates must be reentered in the same sequence as originally traversed, starting at the second point.

## Formulas used:

$$C_L = \Delta N | L | \Sigma | L |$$

$$C_D = \Delta E | D | \Sigma | D |$$

Where:  $C_L$  = Correction to latitude of a course

$C_D$  = Correction to departure of a course

$\Delta N$  = Closing latitude

$\Delta E$  = Closing departure

$L$  = Latitude of a course

$D$  = Departure of a course

## Example:

Values stored in the registers given below are those stored by the Field Angle Traverse (*Surveying 1-1B*) example.

| REGISTER | VALUE   |                            |
|----------|---------|----------------------------|
| 5        | 400.000 | Correct closing easting    |
| 6        | 150.000 | Correct closing northing   |
| 7        | 399.783 | Calculated ending easting  |
| 8        | 149.905 | Calculated ending northing |

Using these values, the transit rule method of adjustment yields the following results:

| POINT NO.             | UNADJUSTED<br>COORDINATES | ADJUSTED<br>COORDINATES |
|-----------------------|---------------------------|-------------------------|
| 2                     | $N = 224.515$             | $N = 224.532$           |
|                       | $E = 561.615$             | $E = 561.684$           |
| 3                     | $N = 356.529$             | $N = 356.576$           |
|                       | $E = 468.600$             | $E = 468.709$           |
| 4                     | $N = 232.337$             | $N = 232.413$           |
|                       | $E = 307.150$             | $E = 307.327$           |
| Ending &<br>Beginning | $N = 149.905$             | $N = 150.000$           |
|                       | $E = 399.783$             | $E = 400.000$           |

| STEP | INSTRUCTIONS  | INPUT<br>DATA/UNITS | KEYS  | OUTPUT<br>DATA/UNITS |

Repeat lines 7-8 until all coordinates have been entered and adjusted.

## TWO INSTRUMENT RADIAL SURVEY

**TWO INSTRUMENT RADIAL SURVEY**

POINT 1    POINT 2    POINT 1    POINT 2    N-E

N-E        N-E        BRG-DIST    BRG-DIST    SOLN

**SURV 1-09A**

06

This program determines the coordinates of a point using a two instrument radial survey technique. The coordinates of the two instrument locations are entered. The bearing and distance to the target point are measured from each of the instrument locations. The solution makes two independent calculations of the coordinates of the target point and outputs the average coordinates of the target point. As an optional check, the program outputs the distance between the two calculated locations of the target point.

**Formulas used:**

$$N = [(N_1 + HD_1 \cos Az_1) + (N_2 + HD_2 \cos Az_2)] / 2$$

$$E = [(E_1 + HD_1 \sin Az_1) + (E_2 + HD_2 \sin Az_2)] / 2$$

- Where: N, E = Northing, easting of target point  
 N<sub>1</sub>, E<sub>1</sub> = Northing, easting of first instrument point  
 N<sub>2</sub>, E<sub>2</sub> = Northing, easting of second instrument point  
 HD<sub>1</sub> = Horizontal distance—point of origin is designated by subscript.  
 Az<sub>1</sub> = Azimuth (converted from bearing)—point of origin is designated by subscript.

Example:

Data at Pt 1  
 Bearing 3° 51' 56"  
 Quad 1  
 Distance 1854.218

Data at Pt 2  
 Bearing 2° 56' 08"  
 Quad 4  
 Distance 1952.562

Distance between target point solutions = 0.001

For successive points measured from the same instrument locations, return to line 6. For new case go to line 2.

## CURVE SOLUTION - GIVEN $\Delta$ & R OR $\Delta$ & T

Given the central angle and either the radius or tangent distance, this program computes four remaining parameters plus the sector, segment and fillet areas.

### Formulas used:

$$T = R \tan (\frac{1}{2}\Delta)$$

$$C = 2 T \cos (\frac{1}{2}\Delta)$$

$$R = T / \tan (\frac{1}{2}\Delta) = C / (2 \sin (\frac{1}{2}\Delta))$$

$$L = \Delta \pi R / 180$$

$$\text{Sector area} = LR/2$$

$$\text{Segment area} = \text{Sector area} - \frac{1}{2} CR \cos (\frac{1}{2}\Delta)$$

$$\text{Fillet area} = T R - \text{Sector area}$$

Where: T = Tangent distance

C = Chord length

L = Arc length

R = Radius

$\Delta$  = Central angle

Example:

$$\begin{aligned} R &= 223.181 \\ \Delta &= 45^\circ 30' 23'' \\ \frac{1}{2}\Delta &= 22^\circ 45' 11'' \\ C &= 172.636 \\ T &= 93.602 \\ L &= 177.258 \\ \text{Sector area } (\nabla) &= 19,780 \\ \text{Segment area } (\frown) &= 2,015 \\ \text{Fillet area } (\wedge) &= 1,110 \end{aligned}$$

\*Input radius or tangent, not both.

Lines 5-7 can be executed at any time after initial parameters have been input.

For new case go to line 2.

### CURVE SOLUTION—GIVEN R & T OR R & L

|  |               |                   |              |
|--|---------------|-------------------|--------------|
| CURVE SOLUTION-GIVEN<br>R & T OR R & L |               | <b>SURV 1-11A</b> |              |
| RADIUS                                 | TANGENT       | ARC<br>LENGTH     | AREA<br>SOLN |
| CURVE<br>SOLN                          | CURVE<br>SOLN |                   |              |

Given the radius and either the tangent or arc length, this program computes four remaining parameters plus the sector, segment and fillet areas.

**Formulas used:**

$$\frac{1}{2}\Delta = \tan^{-1}(T/R) = \sin^{-1}(\frac{1}{2} C/R) = 90L/\pi R$$

$$T = R \tan \frac{1}{2}\Delta$$

$$C = 2 T \cos(\frac{1}{2}\Delta)$$

$$L = \Delta \pi R / 180$$

$$\text{Sector area} = LR/2$$

$$\text{Segment area} = \text{Sector area} - \frac{1}{2} C R \cos(\frac{1}{2}\Delta)$$

$$\text{Fillet area} = TR - \text{Sector area}$$

Where: T = Tangent Distance

C = Chord length

L = Arc length

R = Radius

$\Delta$  = Central angle

Example:

- R = 223.181
- $\Delta = 45^\circ 30' 23''$
- $\frac{1}{2}\Delta = 22^\circ 45' 11''$
- C = 172.636
- T = 93.602
- L = 177.258
- Sector area ( $\nabla$ ) = 19,780
- Segment area ( $\frown$ ) = 2,015
- Fillet area ( $\frown$ ) = 1,110

## ELEVATIONS ALONG A VERTICAL CURVE

ELEVATIONS ALONG  
A VERTICAL CURVE

SURV 1-13A

|                      |                      |                 |                 |                  |  |
|----------------------|----------------------|-----------------|-----------------|------------------|--|
| BEG-END<br>GRADE (%) | BEG STA-<br>ELEV & L | NEXT<br>STATION | MAX-MIN<br>SOLN | ELEV-STA<br>SOLN |  |
|----------------------|----------------------|-----------------|-----------------|------------------|--|

This program computes elevation at any specified station along a vertical curve as well as the elevation at the highest or lowest point on the curve and the station at that point. Program inputs are beginning and ending grades, length of curve, the station and elevation at the beginning of the curve and station at which elevation is desired.

In the program, stations are entered in the form xxxx.xx for station xx + xx.xx. For example, 20 + 10.00 is entered as 2010.00.

### Formulas used:

$$\text{Elevation at any station} = \frac{1}{2} AZ^2 + G_1 Z + E_0$$

$$\text{Distance in stations from beginning station to station of lowest elevation} = -G_1/A$$

Where:  $E_0$  = Elevation at beginning of curve

$Z$  = Distance in 100 foot stations - measured from beginning of curve

$G_1$  = Grade in % at beginning of curve

$G_2$  = Grade in % at end of curve

$A = 100(G_2 - G_1)/L$

$L$  = Length of curve in feet

### Example:

$G_1$  (Beginning Grade) = -1.065%  
 $G_2$  (Ending Grade) = 1.600%  
 $L$  (Length of Curve) = 340 ft.  
 $E_0$  (Elevation at  $G_1$ ) = 614 ft.  
 Beginning station = 17 + 00.00

| STATION    | ELEVATION (E) |
|------------|---------------|
| 18 + 00.00 | 613.327       |
| 19 + 00.00 | 613.438       |
| 20 + 00.00 | 614.332       |
| 20 + 40.00 | 614.910       |

Station of lowest elevation = 18 + 35.87  
 Lowest elevation = 613.276

| LINE | INSTRUCTIONS               | DATA    | KEYS  | DISPLAY |

Lines 7-10 may be repeated if there are no changes in data entered in lines 2-6.

Lines 8-10 may be executed any time after initial curve data is entered.

For a new case go to line 2.

### HORIZONTAL CURVE LAYOUT

|                         |        |              |               |
|-------------------------|--------|--------------|---------------|
| HORIZONTAL CURVE LAYOUT |        | SURV 1-14A   |               |
| RADIUS                  | PC STA | NEXT STATION | DEFL ANG SOLN |
|                         |        |              | CHORD SOLN    |

Given the curve radius, the point of curvature station (P C) and the station on the curve, this program computes deflection angles from the tangent and long chord lengths from the point of curvature.

If regular stationing intervals are used, the short chord will remain constant, thus eliminating calculation of the chord for all but odd interval stations.

In the program, stations are entered in the form xxxx.xx for station xx + xx.xx. For example, 20 + 10.00 is entered as 2010.00.

**Formulas used:**

- Deflection/ft. =  $90/\pi R$
  - Deflection angle =  $L$  (Deflection/ft.)
  - Short chord =  $2 R \sin$  (Deflection angle)
- Where: R = Radius  
L = Arc length

**Example:**

Radius = 900.00 Ft.

| Station    | Arc Length               | Deflection  | Long Chord |
|------------|--------------------------|-------------|------------|
| 12 + 57.00 | (Point of Curvature, PC) |             |            |
| 12 + 75.00 | 18.00                    | 00° 34' 22" | 18.00      |
| 12 + 88.50 | 31.50                    | 01° 00' 10" | 31.50      |
| 13 + 00.00 | 43.00                    | 01° 22' 07" | 43.00      |
| 13 + 25.00 | 68.00                    | 02° 09' 52" | 67.98      |
| 13 + 50.00 | 93.00                    | 02° 57' 37" | 92.96      |

Arc length = Difference in stations

| 6    | Compute chord length     |        | <input type="text"/> E <input type="text"/> | Chord    |

Repeat lines 4-6 for successive stations. PC Sta may be changed any time by executing line 3. For new case start at line 2.

### TRIANGLE SOLUTION - GIVEN SSS OR SAS

TRIANGLE SOLUTION-GIVEN  
SSS OR SAS

SIDE    ANGLE    SSS  
                         SOLN

**SURV 1-15A**

SAS    AREA  
SOLN   SOLN

This program computes the area and the unknown sides and interior angles of two cases of triangles--one which requires three sides to be known and the other which requires two sides and the included angle to be known.

If one case is to be solved immediately after the other, the known parameters must be reentered.

**Formulas used:**

- Area =  $\frac{1}{2} B C \sin c$
- $A^2 = B^2 + C^2 - 2 B C \cos a$
- Where: A = Length of side A
- B = Length of side B
- C = Length of side C
- a = Angle opposite side A
- c = Angle opposite side C

**Example:**

| LINE | INSTRUCTIONS                    | DATA  | KEYS  | DISPLAY |
|------|---------------------------------|-------|---|---------|
| 1    | Enter program                   |       | <input type="text"/> <input type="text"/>     |         |

### TRIANGLE SOLUTION - GIVEN SSA

|                             |       |                   |        |
|-----------------------------|-------|-------------------|--------|
| TRIANGLE SOLUTION-GIVEN SSA |       | <b>SURV 1-16A</b> |        |
| SIDE                        | ANGLE | SOLN A            | SOLN B |
|                             |       | AREA SOLN         |        |
|                             |       | <b>[67]</b>       |        |

This program computes the area and the unknown sides and interior angles of a triangle in which two sides and a non-included angle are the known parameters. Both possible solutions are calculated without reentering the known parameters.

**Formulas used:**

Area =  $\frac{1}{2} BC \sin c$

$A^2 = B^2 + C^2 - 2 BC \cos a$

Where: A = Length of side A

B = Length of side B

C = Length of side C

a = Angle opposite side A

b = Angle opposite side B

c = Angle opposite side C

**Example:**

Solution A

Solution B

## BEARING-BEARING INTERSECT

BEARING-BEARING INTERSECT

SURV 1-18A

|         |         |          |          |      |     |
|---------|---------|----------|----------|------|-----|
| POINT 1 | POINT 2 | LINE 1   | LINE 2   | N-E  | [9] |
| N-E     | N-E     | BRG-QUAD | BRG-QUAD | SOLN |     |

This program computes the point of intersection coordinates of two lines for which the bearing of each line is known and the coordinates of a point on each line are known.

Formulas used:

$$N = ((E_1 - N_1 \tan Az_1) - (E_2 - N_2 \tan Az_2)) / (\tan Az_2 - \tan Az_1)$$

$$E = E_1 - N_1 \tan Az_1 + N \tan Az_1$$

Where:  $Az_1$  = Azimuth of line 1

$Az_2$  = Azimuth of line 2

$N_1, E_1$  = Northing, easting of point 1

$N_2, E_2$  = Northing, easting of point 2

$N, E$  = Northing, easting of intersect point

NOTE: Program will not give a solution if one of the bearings is due east or west

Example:

| LINE | INSTRUCTIONS            | DATA   | KEYS  | DISPLAY |

## BEARING-DISTANCE INTERSECT

BEARING-DISTANCE INTERSECT      SURV 1-19A

|         |         |          |        |      |     |
|---------|---------|----------|--------|------|-----|
| POINT 1 | POINT 2 | LINE 1   | LINE 2 | N-E  | [ ] |
| N-E     | N-E     | BRG-QUAD | DIST   | SOLN |     |

This program calculates the coordinates of the point of intersection of two lines—one of known bearing through known coordinates and the other of known length from a point of known coordinates. Both solutions are computed.

The far solution is obtained by entering the bearing from point 1, and the near solution by entering the bearing into point 1.

Formulas used:

$$AZ_{12} = \tan^{-1} \frac{E_2 - E_1}{N_2 - N_1}$$

$$h = \text{Dist}_{12} \sin \phi$$

$$b = \sqrt{\text{Dist}_2^2 - h^2}$$

$$N = N_1 + ((\text{Dist}_{12} \cos \phi) + b) \cos (AZ_1)$$

$$E = E_1 + ((\text{Dist}_{12} \cos \phi) + b) \sin (AZ_1)$$

Where:  $AZ_{12}$  = Azimuth of line from point 1 to point 2

$AZ_1$  = Azimuth of line 1

$\phi$  = Angle between line 1 and line from point 1 to point 2

h = Perpendicular distance from point 2 to line 1

b = Distance from point of intersection to the point where the perpendicular (h) intersects line 1

$\text{Dist}_2$  = Length of line 2 (the known distance)

$N_1, E_1$  = Northing, easting of point 1

$N_2, E_2$  = Northing, easting of point 2

$\text{Dist}_{12}$  = Distance from point 1 to point 2

Example:

| LINE | INSTRUCTIONS            | DATA    | KEYS        | DISPLAY |
|------|-------------------------|---------|-------------|---------|
| 1    | Enter program           |         | [ ] [ ]     |         |
| 2    |                         | $N_1$   | [ A ] [ ]   |         |
| 3    |                         | $E_1$   | [ A ] [ ]   |         |
| 4    |                         | $N_2$   | [ B ] [ ]   |         |
| 5    |                         | $E_2$   | [ B ] [ ]   |         |
| 6    |                         | Brg 1   | [ C ] [ ]   |         |
| 7    |                         | Quad 1* | [ C ] [ ]   |         |
| 8    |                         | Dist 2  | [ D ] [ ]   |         |
| 9    | Computs intersect coord |         | [ E ] [ ]   | N       |
| 10   |                         |         | [ R/S ] [ ] | E       |

\*There can be two solutions. To obtain the 'near' solution, enter the bearing as into point 1; for the 'far' solution, enter the bearing as away from point 1. For new case start at line 2.

## DISTANCE-DISTANCE INTERSECT

DISTANCE-DISTANCE INTERSECT      SURV 1-20A

|         |         |        |        |      |      |
|---------|---------|--------|--------|------|------|
| POINT 1 | POINT 2 | LINE 1 | LINE 2 | N-E  | [02] |
| N-E     | N-E     | DIST   | DIST   | SOLN |      |

Given two lines, each of known length and originating from two known points, this program computes the intersection coordinates. There are two possible solutions; this program calculates the one found by proceeding in a clockwise direction from the first known point to the second known point. The other solution is found by reversing the entry of the known point coordinates.

Formulas used:

$$\phi = \cos^{-1} \frac{\text{Dist}_{12}^2 + \text{Dist}_1^2 - \text{Dist}_2^2}{2 (\text{Dist}_1) (\text{Dist}_{12})}$$

$$\text{Az} = \tan^{-1} \frac{E_2 - E_1}{N_2 - N_1}$$

$$N = N_1 + \text{Dist}_1 \cos (\text{Az} - \phi)$$

$$E = E_1 + \text{Dist}_1 \sin (\text{Az} - \phi)$$

Where:  $\phi$  = Angle between line 1 and line 1-2  
 $\text{Dist}_{12}$  = Distance from point 1 to point 2  
 $\text{Dist}_1$  = Known distance along line 1  
 $\text{Dist}_2$  = Known distance along line 2  
 $N_1, E_1$  = Northing, easting of point 1  
 $N, E$  = Northing, easting of intersection point  
 $\text{Az}$  = Azimuth of line from point 1 to point 2

Example:

NOTE: Computed solution is always clockwise from point 1 to 2. For alternate solution, start at Point 2.

### DISTANCE FROM A POINT TO A LINE

|                                 |          |        |      |      |            |
|---------------------------------|----------|--------|------|------|------------|
| DISTANCE FROM A POINT TO A LINE |          |        |      |      | SURV 1-21A |
| BASE                            | LINE     | OFFSET | N-E  | DIST |            |
| N-E                             | BRG-QUAD | N-E    | SOLN | SOLN |            |

Given a point of known coordinates with a line of known bearing passing through it and a second point of known coordinates, this program calculates the offset distance from the second point to the line, the distance from the intersection to the first known point, and the coordinates of the intersection.

Formulas used:

$$Dist_{BO} = \sqrt{(N_O - N_B)^2 + (E_O - E_B)^2}$$

$$Dist_{BI} = \sqrt{(N_O - N_I)^2 + (E_O - E_I)^2}$$

$$N_I = \frac{E_O - E_B + N_O \text{ctn}(Az_{BI}) + N_B \tan(Az_{BI})}{\text{ctn}(Az_{BI}) + \tan(Az_{BI})}$$

$$E_I = E_B + (N_I - N_B) \tan(Az_{BI})$$

Where:  $Dist_{BO}$  = Distance from base point to offset point  
 $Dist_{BI}$  = Distance from base point to intersection point  
 $Dist_{IO}$  = Distance from intersection point to offset point  
 $N_O, E_O$  = Northing, easting of offset point  
 $N_B, E_B$  = Northing, easting of base point  
 $N_I, E_I$  = Northing, easting of intersection point  
 $Az_{BI}$  = Known az from base point to intersection point

Example:

## TAPING CORRECTIONS

| TAPING CORRECTIONS |      |               |                  |             | SURV 1-22A    |  |
|--------------------|------|---------------|------------------|-------------|---------------|--|
| LBS PULL           | TEMP | SLOPE<br>DIST | ZNTH ANG<br>SOLN | ANG<br>SOLN | ΔELEV<br>SOLN |  |

This program will apply corrections for tension, temperature, slope, correction index and sag to yield a corrected horizontal distance as measured with a steel tape. Inputs are slope distance and either zenith angle or difference in elevation for each unsupported successive length. Tape constants are stored in the program; however, the program can be customized for any tape by changing the constants stored in the program.

The specified tape constants stored are:

Tape Standardization Tension 20 lbs.

Tape Standardization Temperature 68°F

Tape Correction Index 0.000 ft/100 ft

Tape Unit Weight 0.014 lbs/ft

Tape Coefficient of Thermal Expansion  $6.45 \times 10^{-6} \frac{1}{^{\circ}\text{F}}$

Tape Area x Modulus of Elasticity  $3.0 \times 10^5$  lbs.

To customize the program for any tape, use the following sequence to change the stored tape constants:

1. Enter program
2. Switch to program mode (W/PRGM)—00 00 should be displayed
3. Press **SST** five times—00 should be displayed
4. Press **0 DEL** two times—33 03 should be displayed
5. Press keys to enter tape standardization tension e.g., **1 8** (lbs.)
6. Press **SST** four times—05 should be displayed
7. Press **0 DEL** three times—51 should be displayed
8. Press keys to enter tape area x modulus of elasticity e.g., **3 2 EXX 4** ( $32 \times 10^6$  lbs.)
9. Press **SST** five times—00 should be displayed

10. Press **0 DEL** four times—81 should be displayed
11. Press keys to enter correction index per 100 ft e.g., **0 0 1 2 CHS** (-0.012 ft/100 ft)
12. Press **SST** eleven times—08 should be displayed
13. Press **0 DEL** two times - 12 should be displayed
14. Press keys to enter tape standardization temperature e.g. **6 9** (69° F)
15. Press **SST** seven times - 08 should be displayed
16. Press **0 DEL** six times - 51 should be displayed
17. Press keys to enter coefficient of thermal expansion e.g. **6 6 9 EXX CHS 8** ( $669 \times 10^{-8}/^{\circ}\text{ft}$ )
18. Press **SST** twelve times - 04 should be displayed
19. Press **0 DEL** four times - 33 06 should be displayed
20. Press keys to enter unit weight of tape e.g. **0 0 1 8** (.018 lbs/ft)
21. Record changed program by inserting blank card in reader slot
22. Switch to run mode
23. Enter changed program and test

NOTE: The total number of keys pressed to enter tape constants must not exceed 30. The above examples show 23.

To change program to accept vertical angles instead of zenith angles, use the following sequence:

1. Enter program
2. Press **GTO D**
3. Switch to program mode (W/PRGM) - 14 should be displayed.
4. Press **SST** four times—04 should be displayed
5. Press **0 DEL** one time—31 should be displayed
6. Press **5**
7. Record changed program by entering blank card in reader slot
8. Switch to run mode
9. Enter changed program and test

## Formulas used:

$$C_C = C_1 L/100$$

$$C_P = L(P - P_o)/AE$$

$$C_T = C_X L(T - T_o)$$

$$C_S = W^2 L^3/24 P^2$$

$$\text{Corrected S Dist} = S \text{ Dist} + C_C + C_P + C_T + C_S$$

$$H \text{ Dist} = (\text{Corrected S Dist}) \sin(\text{Znth ang})$$

$$H \text{ Dist} = \sqrt{(\text{Corrected S Dist})^2 - (\Delta \text{ Elev})^2}$$

Where: P = Tension on tape in pounds (pull)

P<sub>o</sub> = Standard tension in pounds

A = Cross section area of tape in square inches

E = Modulus of elasticity for the tape material

C<sub>X</sub> = Coefficient of thermal expansion for the tape

T = Temperature at time of reading in °F

T<sub>o</sub> = Standard temperature in °F

W = Weight of tape per foot in pounds

L = Distance between supports in feet

C<sub>C</sub> = Index correction

C<sub>P</sub> = Correction for tension

C<sub>T</sub> = Correction for temperature

C<sub>S</sub> = Correction for sag

Znth ang = Zenith angle

C<sub>1</sub> = Tape correction index in ft/100 ft.

## Example:

## ZNTH ANG KNOWN

Pull = 25 lbs

Temp = 88°F

S Dist = 100'

Znth Ang = 88° 00' 00"

H Dist = 99.941

S Dist = 75.35

Znth Ang = 90° 00' 00"

H Dist = 75.355

Σ H Dist = 175.296

## Δ ELEV KNOWN

Pull = 25 lbs

Temp = 88°F

S Dist = 100'

Δ Elev = 3.49

H Dist = 99.941

S Dist = 75.35

Δ Elev = 0

H Dist = 75.355

Σ H Dist = 175.296

|--------|----------|------------------|--------------------|----------------------|

This program reduces slope distance to horizontal distance at the instrument elevation and at sea level and gives the difference in elevation between two stations. The program will correct for the differences between the heights of the instruments and the heights of the targets. Corrections due to the curvature of the earth and the refraction of light are obtained by multiplying a derived constant times the horizontal distance. The value used for the coefficient of refraction is 0.071.

### Formulas used:

$$Z_1 = Z - c + r + \sin^{-1} \left[ \frac{\Delta \sin(Z - 2c + r)}{S \text{ Dist}} \right]$$

$$H \text{ Dist} = \frac{S \text{ Dist}}{\cos c} \sin(Z_1 - c) \left[ \frac{R}{R + E} \right]$$

$$\Delta \text{ Elev} = \frac{S \text{ Dist}}{\cos c} \cos Z_1 + (HI \text{ DM} - HT \text{ Rft})$$

$$c = 14 \times 10^{-7} S \text{ Dist} \sin Z \text{ from } \frac{S \text{ Dist} \sin Z}{2R} \frac{180}{\pi}$$

$$r = 2 \times 10^{-7} S \text{ Dist} \sin Z \text{ from } \frac{0.071 S \text{ Dist} \sin Z}{R} \frac{180}{\pi}$$

Where: S Dist = Slope Distance

Z = Zenith angle

Z<sub>1</sub> = Zenith angle corrected for c & r and Δ

H Dist = Horizontal distance

Δ Elev = Difference in elevation

c = Zenith correction due to earth's curvature in degrees

r = Correction due to refraction in degrees

R = 20,906,000 ft. (radius of earth)

E = Elevation of instrument

Δ = Height of DM - Height of Reflector - Height of Theodolite + Height of Target

Example:

Slope Distance

Elev at Instrument

Zenith Angle

Height of DM

Height of Reflector

Height of Theodolite

Height of Target

Horizontal Distance (E)

Horizontal Distance (SL)

Elevation Difference

S Dist = 10,000 ft.

### EDM SLOPE REDUCTION GIVEN Δ ELEVATION

EDM SLOPE REDUCTION-  
GIVEN Δ ELEVATION

S DIST HI DM HT RFT ΔELEV H DIST  
SOLN

**SURV 1-24A**

Taking into consideration the curvature of the earth, this program reduces slope distance to horizontal distance at the instrument station elevation. The program assumes the slope distance between two points having known elevations was measured using an Electronic Distance Measuring Instrument. As options, the program will reduce the slope distance to a horizontal distance at sea level, and to a horizontal distance at any specified elevation. The value used for the radius of the earth is 20,906,000 feet.

Formulas used:

$$H \text{ Dist} = \sqrt{\frac{(S \text{ Dist})^2 - (E_2 + HT \text{ Rft} - E_1 - HI \text{ DM})^2}{(R + E_1 + HI \text{ DM})(R + E_2 + HT \text{ Rft})}} \quad [R + E]$$

- Where:
- S Dist = Slope Distance
  - E<sub>1</sub> = Elevation of Instrument Station
  - HI DM = Height of Instrument
  - E<sub>2</sub> = Elevation of Reflector Station
  - Ht Rft = Height of Reflector
  - R = Radius of the Earth (20,906,000 ft.)
  - E = Elevation of Horizontal Distance
  - H Dist = Horizontal Distance

Example:

- Slope Distance
- Height of DM
- Height of Reflector
- Elev at DM Station
- Elev at Reflector Station
- Specified Elevation
- Horizontal Distance (E<sub>1</sub>)
- Horizontal Distance (Sea Level)
- Horizontal Distance (E<sub>S</sub>)

- S Dist = 10,000 ft.
- HI DM = 5.12
- HT Rft = 5.75
- E<sub>1</sub> = 1000.00
- E<sub>2</sub> = 3590.63
- E<sub>S</sub> = 2000
- H Dist = 9657.834
- H Dist = 9657.372
- H Dist = 9658.296

| LINE | INSTRUCTIONS                   | DATA           | KEYS                                      | DISPLAY                 |

## FIELD ANGLE CHECK

|                   |                |               |                 |
|-------------------|----------------|---------------|-----------------|
| FIELD ANGLE CHECK |                | SURV 1-25A    |                 |
| REF AZ            | ANGLE<br>LT-RT | DEFL<br>LT-RT | BEARING<br>SOLN |
|                   |                |               | ANG COR<br>SOLN |

This program accepts a reference azimuth and field angles at each point in a traverse. The field angles are converted to bearings for each leg. At closing, the final leg is compared to the reference azimuth and the angular error of closure computed. The program can also handle traverses between two points.

## Formulas used:

Angular error = (Reference azimuth - 180) - Last course azimuth

Angular correction = - Angular error/Number of angles

## Example:

Reference Azimuth =  $193^{\circ} 30' 00''$

Last Course Azimuth =  $13^{\circ} 29' 52''$

Angular Error =  $00^{\circ} 00' 08''$

Angular Correction (to be applied to interior angles) =

$-00^{\circ} 00' 02''$

| 9    | Optional: Compute azimuth          |         | <input type="text"/> R/S <input type="text"/>   | Az        |
|      | (Repeat lines 3-9 for each course) |         | <input type="text"/> <input type="text"/>       |           |
| 10   | Compute angular error              |         | <input type="text"/> E <input type="text"/>     | Ang Error |
| 11   |                                    |         | <input type="text"/> R/S <input type="text"/>   | Ang Corr  |

If checking traverse between two points, the closing reference azimuth is entered via key A; angular error is then obtained at line 10.

To run another problem, press   then return to line 2.

## STADIA REDUCTIONS

STADIA REDUCTIONS SURV 1-26A

STATION ELEV.-HI ZENITH ANGLE ROD INTERVAL ROD READING DIST.-ELEV SOLN

This program computes the elevation of and horizontal distance to points from an instrument station using stadia methods. Required inputs are the height of instrument, the zenith angle, the rod reading, and the rod stadia interval.

The program assumes stadia constant = 0, and stadia interval factor (K) = 100.

Slope angles are assumed to be entered as zenith angles. To change the program to use vertical angles, the following sequence must be followed:

1. Enter program
2. Press **GTO** **B**
3. Switch to program mode (W/PRGM) - 12 should appear in the display
4. Press **SST** (single step) 6 times - 51 should appear in the display
5. Press **□** **DEL** - 35 07 should appear in the display
6. Press **SST** four times - 03 should appear in the display
7. Press **□** **DEL** twice - 35 00 should appear in the display
8. Record changed program by inserting blank card in reader slot
9. Switch back to run mode
10. Enter changed program and test

## Formulas used:

$$H \text{ Dist} = K s \cos^2 (V \text{ ANG})$$

$$V = \frac{1}{2} K s \sin 2 (V \text{ ANG})$$

$$\text{Pt Elev} = \text{HI} + V - \text{Rod reading} + \text{occupied station elevation}$$

$$\text{Vert Ang} = 90 - \text{Znth Ang}$$

Where: K = Stadia interval

s = Rod interval

Vert Ang = Vertical angle of line of sight ( $0^\circ$  is horizontal)  
 H Dist = Horizontal distance  
 V = Vertical distance  
 HI = Height of instrument

Example:

| POINT NO. | HI  | ZENITH ANGLE | ROD INTERVAL | ROD READING | HORIZONTAL DISTANCE | ELEVATION |
|-----------|-----|--------------|--------------|-------------|---------------------|-----------|
| Occ Sta.  | 5.2 |              |              |             |                     | 491.0     |

For additional points from same instrument station, repeat lines 4-8.  
 For new case start at line 2.

Notes

### THREE WIRE LEVELING

| THREE WIRE LEVELING |               |               | SURV 1-27A       |                          |
|---------------------|---------------|---------------|------------------|--------------------------|
| STARTING<br>ELEV-K  | BACK<br>SIGHT | FORE<br>SIGHT | U.C.L<br>READING | SOLN                     |
|                     |               |               |                  | <input type="checkbox"/> |

After the initial entry of the starting elevation and stadia interval factor (if it is not 100), this program uses the upper stadia hair, crosshair, and lower stadia hair readings to provide the elevation difference, elevation of final point, backsight distances and foresight distances.

If no stadia interval constant, K, is entered, the value used by the calculator is 100.

Formulas used:

$$\text{Elev 2} = \text{Elev 1} + \left[ \frac{U+C+L}{3} \right] \text{BS} - \left[ \frac{U+C+L}{3} \right] \text{FS}$$

$$\text{Dist} = K [\Sigma \text{BS } \frac{1}{2} \text{ stadia intv} + \Sigma \text{FS } \frac{1}{2} \text{ stadia intv}]$$

$$\text{Check} = 2C - U - L$$

Where: U = Upper reading  
C = Center reading  
L = Lower reading  
BS = Backsight  
FS = Foresight  
K = Stadia constant

Example:

| NO OF STATION | U.C.L READING BACKSIGHT | % STADIA INTERVAL BACKSIGHT | U.C.L READING FORESIGHT | % STADIA INTERVAL FORESIGHT | ELEV OF STATION |
|---------------|-------------------------|-----------------------------|-------------------------|-----------------------------|-----------------|
| ELEV 5280.000 |                         |                             |                         |                             |                 |
| 1             | 8.286<br>8.105<br>7.940 | .161<br>.166                | 3.491<br>3.320<br>3.162 | .171<br>.166                | 5284.783        |

## SLOPE STAKING— GIVEN CENTERLINE TERRAIN ELEVATION

|   |                     |                    |              |
|---|---------------------|--------------------|--------------|
| SLOPE STAKING-GIVEN<br>CENTERLINE TERRAIN ELEVATION |                     | SURV 1-28A         |              |
| HG DIST-<br>SLOPE                                   | ℄ T ELEV<br>HG ELEV | S DIST<br>VERT ANG | H DIST<br>Δh |
|   |                     |                    | SOLN         |

Using a previously located center line and the design cross section to provide center line terrain and hinge point elevations, this program helps in the setting of slope stakes. The program produces a distance for the rod man to move from his present trial point to a new trial point which should be very close to the catch point.

The trial point may be entered by either of two methods—slope distance and vertical angle or horizontal distance and elevation difference. All input data is measured with reference to the center line and its terrain elevation.

Slope is entered as a ratio to 1. For example, a 1½:1 slope is entered as 1.5. Cut slopes are entered as positive and fill slopes as negative.

### Formulas used:

$$E = \text{HG Dist} + \text{Slope} (\text{T Elev} - \text{HG Elev} + \Delta h) - \text{H Dist};$$

$$\text{H Dist}_{i+1} = \text{H Dist}_i + E \text{ (until } E < 0.1)$$

$$\Delta h = \text{S Dist} \sin (\text{V ANG})$$

$$\text{H Dist} = \text{S Dist} \cos (\text{V ANG})$$

Where: HG Dist = Distance from centerline to hinge point

T Elev = Terrain elevation at centerline

HG Elev = Elevation at hinge point

Δh = Elevation difference from T Elev to trial point

H Dist<sub>i</sub> = Horizontal distance from centerline to trial point; it is varied until tolerance is reached.

E = Error term

S Dist<sub>i</sub> = Slope distance from centerline to trial point.

V ANG = Vertical Angle

Example:

| INPUT   |          | FILL    | CUT      |
|---|----------|---------|----------|
| Horizontal distance to hinge pt.  | HG Dist  | +12     | +18      |
| Slope (ratio of horizontal distance to 1)   | Slope    | -1.5    | +1       |
| Centerline terrain elevation  | ℄ T Elev | 5280.00 | 5280.00  |
| Hinge pt. elevation   | HG Elev  | 5286.00 | 5282.00  |

## SLOPE STAKING— GIVEN CENTERLINE CUT/FILL

SLOPE STAKING-GIVEN  
CENTERLINE CUT/FILL

SURV 1-29A

HG DIST-      C C OR F      S DIST      H DIST      SOLN  
SLOPE        V DROP      VERT ANG    Δh

Using a previously located center line and the design cross section to provide cut or fill at center line and vertical drop from center line elevation to hinge point elevation, this program helps in the setting of slope stakes. The program produces a distance for the rod man to move from his present trial point to a new trial point which should be very close to the catch point.

The trial point may be entered by either of two methods—slope distance and vertical angle or horizontal distance and elevation difference. All data is measured in reference to the center line and its terrain elevation.

Slope is entered as a ratio to 1. For example, a 1½:1 slope is entered as 1.5. Cut slopes are entered as positive and fill slopes as negative.

**Formulas used:**

- $E = HG\ Dist + Slope ((cut\ or\ fill) + V\ drop + \Delta h) - H\ Dist_i$
  - $H\ Dist_{i+1} = H\ Dist_i + E$  (until  $E \leq 0.1$ )
  - $\Delta h = S\ Dist\ sin\ (VANG)$
  - $H\ Dist = S\ Dist\ cos\ (V\ ANG)$
- Where:
- HG Dist** = Distance from centerline to hinge point
  - Cut or fill** = Depth to final grade at centerline; fill designated by negative sign
  - V Drop** = Vertical drop from centerline elevation to hinge point
  - Δh** = Elevation difference from centerline elevation to trial point
  - Vert ang** = Vertical angle from centerline elevation to trial point
  - H Dist<sub>i</sub>** = Horizontal distance from centerline to trial point
  - S Dist<sub>i</sub>** = Slope distance from centerline to trial point.
  - V ANG** = Vertical Angle

Example:

| INPUT   |          | FILL     | CUT     |
|---|----------|----------|---------|
| Horizontal distance to hinge pt.                          | HG Dist  | 12       | 18      |
| Slope (ratio to 1)  | Slope    | -1.5     | 1       |

## AZIMUTH OF THE SUN

|                    |                    |          |                    |                 |   |
|--------------------|--------------------|----------|--------------------|-----------------|---|
| AZIMUTH OF THE SUN |                    |          |                    | SURV 1-30A      |   |
| TIME-<br>T ZONE    | DECLIN-<br>HR DIFF | LATITUDE | VERT ANG<br>TO SUN | AZIMUTH<br>SOLN |  |

This program will yield azimuth of the sun from solar observations. Data which are entered here are assumed to be mean values with appropriate corrections made where necessary prior to operation of the program. Since the result is the sun's azimuth from north, it is left to the observer to add or subtract the angle turned to a backsite to determine the azimuth between two points.

### Formulas used:

$$Az = \cos^{-1} \left[ \frac{\sin \delta - \sin \phi \sin (V \text{ ANG})}{\cos \phi \cos (V \text{ ANG})} \right]$$

Where: Az = Azimuth from north  
 $\delta$  = Hr diff (Time + T Zone) + Declination  
 $\phi$  = Latitude of observer's position  
 Vert ang = Vertical angle to sun

Example:

Date: 18 July 1973

Time of observation: 15 hrs 38 min 37 sec (EST)

Longitude of standard meridian (time zone): 5 hrs

Declination at 0 hrs. (ephemeris):  $21^{\circ} 05' 36''$

Hour difference in declination (ephemeris)  $-00^{\circ} 00' 26.4''$

Latitude ( $\phi$ ):  $43^{\circ} 00' 34''$  N

Mean corrected vertical angle to sun:  $33^{\circ} 34' 49''$

Calculated north azimuth of sun:  $268^{\circ} 07' 54''$

Input all angles as degrees, minutes and seconds in the form DDD.MMSS. Times are based on a 24 hour clock and are input as HH.MMSS (4 pm becomes 16 hours).

If the declination is North—it will have a positive value, and if the declination is South—it will be negative.

If the declination is on the increase, the hour difference will have a positive value, and if the declination is on the decrease, the hour difference will be negative.

### PREDETERMINED AREA - LINE THRU A POINT

|                    |         |            |      |
|--------------------|---------|------------|------|
| PREDETERMINED AREA |         | SURV 1-31B |      |
| LINE THRU A POINT  |         |            |      |
| REQUIRED POINT 1   | POINT 2 | BRG-QUAD   | N-E  |
| AREA               | N-E     | N-E        | SOLN |

This program solves one of the two cases of specifying the area of a land parcel, namely, that of hinging a side. First, the user breaks the area into a triangle and then uses this program to hinge the side to force the area to a predetermined value. Required inputs are the coordinates of the two known points, the bearing of the second side and the desired area. Outputs are coordinates of the unknown point.

In the example below, the coordinates of point 3 are unknown. A line passing through point 1 (the hinge point) will intersect at only one place on the line 2+3 which satisfies the area requirements.

**Formulas used:**

- Area = 1/2 (b) (h)
  - h = a sin θ
  - Area = 1/2 (b) (a sin θ)
  - a =  $\frac{2 \text{ Area}}{b \sin \theta}$
  - N = N<sub>2</sub> + a cos (Az)
  - E = E<sub>2</sub> + a sin (Az)
- Where:
- b = Length of line 1→2
  - h = Height of the triangle
  - a = Length of line 2→3
  - θ = Angle 123
  - Az = Azimuth of line 2→3

Example:

| LINE | INSTRUCTIONS     | DATA           | KEYS  | DISPLAY |

## PREDETERMINED AREA— TWO SIDES PARALLEL

PREDETERMINED AREA  
TWO SIDES PARALLEL  
REQUIRED AREA    BASE 1 LENGTH    ANGLE TO SIDE 1    ANGLE TO SIDE 2    SOLN

SURV 1-32A

This program solves one of the two cases of specifying the area of a land parcel, namely, that of sliding a side along a fixed bearing. First, the user breaks the area into a trapezoid and then uses this program to slide the side to force the area to a predetermined value. Computed values include the lengths of the non-parallel sides, the length of the second parallel base and the angles formed by the intersection of each non-parallel side with the second base (angles 3 and 4 in diagram).

In the diagram, base 2 (side 4-3) is the side being moved.

### Formulas used:

$$\text{Area} = \frac{1}{2} (b_1 h + b_2 h)$$

$$b_2 = b_1 - h(\text{ctn } \theta + \text{ctn } \phi)$$

$$\text{Area} = \frac{1}{2} (b_1 h + (b_1 - h(\text{ctn } \theta + \text{ctn } \phi))h)$$

$$\text{Area} = b_1 h - \frac{1}{2} (\text{ctn } \theta + \text{ctn } \phi) h^2$$

$$h = \frac{b_1 - \sqrt{b_1^2 - 2A(\text{ctn } \theta + \text{ctn } \phi)}}{\text{ctn } \theta + \text{ctn } \phi}$$

$$r_1 = h/\sin \theta$$

$$r_2 = h/\sin \phi$$

$$\theta' = 180 - \theta$$

$$\phi' = 180 - \phi$$

Where: A = Area  
 $b_1$  = Length of base 1  
 $b_2$  = Length of base 2  
 $h$  = Altitude of trapezoid  
 $\theta$  = Angle between base 1 and side 1 (Angle 1)

$\phi$  = Angle between base 1 and side 2 (Angle 2)  
 $r_1$  = Length of side 1  
 $r_2$  = Length of side 2  
 $\theta'$  = Angle between base 2 and side 1 (Angle 4)  
 $\phi'$  = Angle between base 2 and side 2 (Angle 3)

Example:

| LINE | INSTRUCTIONS                | DATA   | KEYS  | DISPLAY |

| 6    | Compute length of 2nd base  |        | <input type="text"/> E <input type="text"/>   | Base 2  |
| 7    | Compute non-parallel side 1 |        | <input type="text"/> R/S <input type="text"/> | Side 1  |
| 8    | Compute non-parallel side 2 |        | <input type="text"/> R/S <input type="text"/> | Side 2  |
| 9    | Compute 2nd angle to side 1 |        | <input type="text"/> R/S <input type="text"/> | Angle 4 |
| 10   | Compute 2nd angle to side 2 |        | <input type="text"/> R/S <input type="text"/> | Angle 3 |

NOTE: This program will not solve a parallelogram.  
 (i.e. sides 1 and 2 parallel)  
 For new case start at line 2.

## VOLUME BY AVERAGE END AREA

VOLUME BY AVERAGE END AREA SURV 1-33A  
 ELEV FROM C DIST FROM C STA AREA SOLN STATION INTERVAL VOLUME SOLN

This program computes end area for any station, volume from previous station, and accumulated volume to the present station. Inputs are the elevations and distances from the centerline for all points of a cross section and the interval from the previous station.

When entering elevations and distances from center line for a particular station, start with center point (0,0). The storage registers must be cleared between successive problems.

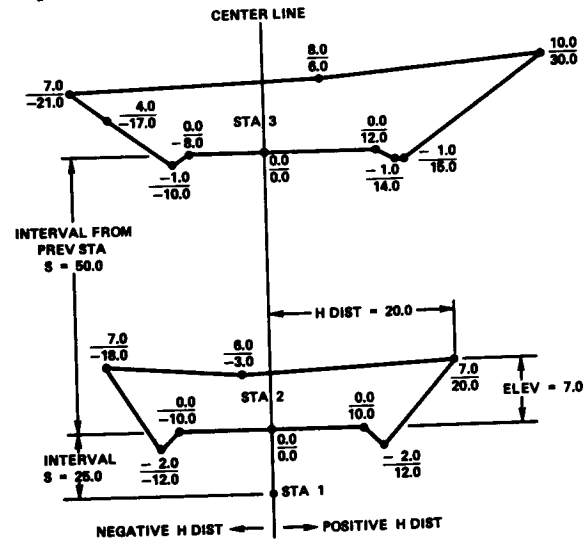

### Formulas used:

$$V_{avg} = (Area_i + Area_{i-1}) I / 2$$

$$Area = \frac{1}{2} [Elev_1 (H Dist_2 - H Dist_n) + Elev_2 (H Dist_3 - H Dist_1) + \dots + Elev_n (H Dist_1 - H Dist_{n-1})]$$

Where:  $V_{avg}$  = Average volume between two stations  
 Area = Cross sectional area at a station  
 H Dist = Horizontal distance from centerline at cross section  
 Elev = Elevation at a point on the cross section  
 I = Interval between stations  
 Subscript i refers to current point  
 Subscript n refers to last point  
 Numeric subscript refers to point number

Example:

| STA | AREA  | INTERVAL (Ft) | VOLUME (cubic feet) | $\Sigma$ VOLUME (cubic yards) |
|-----|-------|---------------|---------------------|-------------------------------|
| 1   | 0     |               |                     |                               |
| 2   | 216   | 25            | 2,700               | 100                           |
| 3   | 321.5 | 50            | 13,437.5            | 597.7                         |

NOTE: Traverse sections in clockwise direction to insure positive areas and volumes.

For new case, press **1** **REG**, and start at line 2.

### VOLUME OF BORROW PIT

VOLUME OF BORROW PIT SURV 1-34A

▲ BASE-HT
□ W-L
ELEV
GRID SEC VOL SOLN
ACC VOL SOLN
S

This program calculates volume of fill which can be taken from a borrow pit given grid dimensions and elevations at the grid intersections. Volume is available for each grid section and also as an accumulative volume for all previous sections.

If several grid blocks have the same horizontal dimensions, the sum of the volumes of all these blocks can be calculated at once. This is done by entering all of the elevations using the "C" key before pressing the "D" key to compute the volume. For example, if three rectangular blocks have the same dimensions, the 12 elevations are entered before pressing the "D" key.

**Formulas used:**

$$Vol_{\Delta} = \frac{1}{2} (\text{Base}) (\text{Ht}) (\text{Elev})$$

$$Vol_{\square} = (\text{Width}) (\text{Length}) (\text{Elev})$$

- Where:
- $Vol_{\Delta}$  = Volume of triangular grid section
  - Base = Base of triangle
  - Ht = Height of triangle
  - Elev = Elevation of grid section (depth of cut)
  - $Vol_{\square}$  = Volume of rectangular grid section
  - Width = Width of rectangle
  - Length = Length of rectangle

Example:

| LINE | INSTRUCTIONS  | DATA   | KEYS  | DISPLAY |
|------|---|--------|---|---------|
